

LETTER OF ATTESTATION

This letter is to address the recent 700 MHz band restriction and the corrective action to be taken for the UR1H L3 (FCCID: DD4UR1HC) in order to prevent it from encroaching into the restricted band.

Testing for the UR1H L3 was performed on October 22, 2007, well before the FCC ruling regarding the 700MHz band restriction. The recent submittal for approval was made in order to increase the product catalog for this product line and broaden the product availability to the customer. The corrective action stated below will show that we intend to release a product that will be in compliance of the FCC rules. That being said, we are requesting that the data provided in the test report submitted be sufficient to prove compliance.

Shure will remove the operation at 698MHz by limiting the band of operation to the customer from 638.000-697.875 MHz. The product will be reprogrammed via software with the new band edge, which will restrict access manually to any frequency beyond 697.875 MHz. All internal documentation will also be changed to reflect the adjustment and insure that the product is restricted. As is seen in the test report, by setting the band edge to 697.875 MHz, the product will be in compliance with the Band Edge requirements based on the Emissions Mask data provided within the test report. The plots show that the product will fall well below the Band Edge requirement of -13dBm as the product behaves similarly at all the frequencies, which will include the band edge.

The financial burden of retesting the product would prevent the release of a product line that has proven to help increase our visibility to a larger scope of customers in Europe. The strong demand for the product from our customers as prompted us to submit the product for release in North America.

Dated this 8th day of December, 2008.
