Description of EUT :

a) Type of EUT : XS WIRELESS

b) Trade Name : SENNHEISER

c) Model No. : SKM-XSW

d) FCC ID : DMOSKMXSW

e) Working Frequency : 548~572 MHz

f) Power Supply : 2x 1.5V AA batteries

Regulation Applied: FCC Rules and Regulations Part 74 Subpart H

I HEREBY CERTIFY THAT; The data shown in this report were made in accordance with the procedures given in ANSI C63.10-2013 and the energy emitted by the device was founded to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these data.

Issued Date : Jul. 27, 2023

3. GENERAL INFORMATION

3.1 Product Description

- a) Type of EUT : XS WIRELESS
- b) Trade Name : SENNHEISER
- c) Model No. : SKM-XSW
- d) FCC ID : DMOSKMXSW
- e) Working Frequency : 548 MHz ~ 572 MHz
- f) Power Supply : 2x 1.5V AA batteries

3.2 Test Methodology

Both conducted and radiated testing were performed according to the procedures in FCC CFR Title 47 Part 74 Subpart H, ANSI C63.26-2015, ANSI C63.10-2013 and ANSI C63.4-2014. Test also follow “TIA-603-E(2016)-Land Mobile FM or PM Communications Equipment Measurement and Performance Standards” and section 2.1046, 2.1047, 2.1049, 2.1051, 2.1053, and 2.1055 of FCC Part 2 FREQUENCY ALLOCATIONS AND RADIO TREATY MATTERS; GENERAL RULES AND REGULATIONS.

3.3 Test Facility

The open area test site and conducted measurement facility used to collect the radiated data is located on the roof top of Building at No.34, Lin 5, Dingfu Vil., Linkou Dist., New Taipei City, Taiwan 24442, R.O.C.

Designation Number: TW2628.

4. REQUIREMENTS OF PROVISIONS

4.1 Definition

Intentional radiator:

A device that intentionally generates and emits radio frequency energy by radiation or induction.

4.2 Frequencies Available

According to sec. 74.802(a)(1) of Part 74, Frequencies within the following bands may be assigned for use by low power auxiliary stations:

Frequencies (MHz)

26.100-26.480	455.000-456.000
54.000-72.000	470.000-488.000
76.000-88.000	488.000-494.000
161.625-161.775	494.000-608.000
174.000-216.000	614.000-806.000
450.000-451.000	944.000-952.000

According to sec. 74.802(a)(2) of Part 74, The 653.000-657.000 MHz segment of the 600 MHz duplex gap may be assigned for use by low power auxiliary service.

4.3 Requirements for Radio Equipment on Certification

(1) RF Output Power

For transmitters, the power output shall be measured at the RF output terminals.

(2) Modulation Characteristics

For Voice Modulated Communication Equipment, a curve or equivalent data showing the frequency response of the audio modulating circuit over a range of 100 to 5000 Hz shall be submitted.

(3) Occupied Bandwidth

For radiotelephone transmitter, other than single sideband or independent sideband transmitter, when modulated by a 2.5kHz tone at an input level 16 dB greater than that necessary to produce 50 percent modulation.

(4) Spurious Emissions at Antenna Terminals

The radio frequency voltage or power generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminal when properly loaded with a suitable artificial antenna.

(5) Field Strength of Spurious Emissions

Measurements shall be made to detect spurious emission that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal condition of installation and operation.

(6) Frequencies Tolerance

- a) The frequency stability shall be measured with variation of ambient temperature.
- b) The frequency stability shall be measured with variation of primary supply voltage.

4.4 Labeling Requirement

Each equipment for which a type acceptance application is filed on or after May 1,1981, shall bear an identification plate or label pursuant to §2.925 (Identification of equipment) and §2.926 (FCC identifier) .

4.5 Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated fortests performed on the EUT as specified in CISPR 16-4-2:

Measurement	Frequency	Uncertainty
Conducted emissions	9kHz ~ 30MHz	±3.34dB (Mains)(LISN)
Radiated emissions	9kHz ~ 30MHz	±4.22dB
Radiated emissions / Effective Radiated Power (3m RF Chamber)	30MHz ~ 1GHz	±4.2dB (30MHz ≤ f ≤ 300MHz)
		±4.44dB (300MHz < f ≤ 1GHz)
	Above 1GHz	±4.44dB (1GHz ≤ f ≤ 18GHz)
		±3.02dB (18GHz ≤ f ≤ 40GHz)
Conducted Measurement	9kHz ~ 40GHz	±0.88dB (9kHz ≤ f ≤ 30MHz)
		±0.88dB (30MHz < f ≤ 1GHz)
		±1.04dB (1GHz ≤ f ≤ 18GHz)
		±1.2dB (18GHz ≤ f ≤ 40GHz)
Frequencies Tolerance (Ambient temperature & Supply voltage)	9kHz ~ 40GHz	±4.04×10 ⁻⁸
Occupied Bandwidth	9kHz ~ 40GHz	±5%
Modulation Characteristics / Frequency deviation	9kHz ~ 1GHz	±1.38%

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

The test result(s) does not consider the uncertainty of measurement when the test standard(s) and/or test method which refer by the labs has the limit or judgments for the test result(s).

5. FIELD STRENGTH OF EMISSION

5.1 Provisions Applicable

According to §2.1053, measurements shall be made to detect spurious emission that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal condition of installation and operation. Information submitted shall include the relative radiated power of spurious emission with reference to the rated power output of the transmitter, assuming all emissions are radiated from a halfwave dipole antenna.

According to §74.861(e)(6), the mean power of emissions shall be attenuated below the mean output power of the transmitter in accordance with the following schedule:

- (i) on any frequency removed from the operating frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: at least 25 dB.
- (ii) on any frequency removed from the operating frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: at least 35 dB.
- (iii) on any frequency removed from the operating frequency by more than 250 percent of the authorized bandwidth shall be attenuated below the unmodulated carrier by at least 43 plus 10 Log(output power in watts) dB.

5.2 Measurement Procedure

Test Procedure used ANSI C63.26-2015 – Section 5.7

1. Setup the configuration per figure 4 and 5 for frequencies measured below and above 1 GHz respectively.
2. For emission frequencies measured below and above 1 GHz, set the spectrum analyzer on a 100 kHz and 1 MHz resolution bandwidth respectively.
3. The search antenna is to be raised and lowered over a range from 1 to 4 meters in horizontally polarized orientation. Position the highness when the highest value is indicated on spectrum analyzer, then change the orientation of EUT on test table over a range from 0 ° to 360 ° with a speed as slow as possible, and keep the azimuth that highest emission is indicated on the spectrum analyzer. Vary the antenna position again and record the highest value as a final reading. A RF test receiver is also used to confirm emissions measured.
4. Repeat step 3 until all frequencies need to be measured were complete.
5. Repeat step 5 with search antenna in vertical polarized orientations.
6. Check the three frequencies of highest emission with varying the placement of cables associated with EUT (if any) to obtain the worse case and record the result.

Note:

According to 12.7.2(d)(2) of ANSI C63.10-2013:

$$E[\text{dB}\mu\text{V}/\text{m}] = \text{EIRP}[\text{dBm}] + 95.2, \text{ for } d = 3 \text{ m.}$$

12.7.2(e) of ANSI C63.10-2013:

For conducted measurements below 1000 MHz, the field strength shall be computed as specified in item d), and then an additional 4.7 dB shall be added as an upper bound on the field strength that would be observed on a test range with a ground plane for frequencies between 30 MHz and 1000 MHz, or an additional 6 dB shall be added for frequencies below 30 MHz.
