

## FCC Part 24 Transmitter Certification

### Test Report

FCC ID: DNY0A1EKLNK1900

FCC Rule Part: CFR 47 Part 24 Subpart E

ACS Report Number: 05-0458-24H

Manufacturer: EMS Wireless  
Equipment Type: PCS Fiber-optic RF Distribution Remote Unit  
Model: EkoLink II 1900

Test Begin Date: January 6, 2006

Test End Date: February 8, 2006

Report Issue Date: March 14, 2006

FOR THE SCOPE OF ACCREDITATION UNDER LAB Code 200612

## 1.0 GENERAL

### 1.1 Purpose

The purpose of this report is to demonstrate compliance with Part 2 Subpart J and Part 24 Subpart E of the FCC's Code of Federal Regulations.

### 1.2 Product Description

The EkoLink II System is designed to distribute Cellular and PCS radio signals within a building or campus of buildings where coverage/capacity would be otherwise impeded. Using fiber optics to distribute the signals, and a network of local antennas, the coverage area can be greatly enhanced. In an alternative system that covers a building by distributing radio base stations, one must add a base station in that area when faced with the problem of poor coverage in one section. Thus, capacity is added to a section which might not need it. Similarly, when faced with a capacity problem in a portion of the building, one would need an additional base station regardless of whether additional coverage is required.

Detailed photographs of the EUT are filed separately with this filing.

The EkoLink II 1900 is part of a product line that consist of a 800 PCS version as well as more compact lower power versions known as the EkoLite II 800 and 1900. Some documents contained in this filing may reference other models, configurations, or system components but the purpose of this report is to show compliance for the EkoLink II 1900 MHz remote unit only.

Detailed photographs of the EUT are filed separately with this filing.

### 1.3 Technical Specifications

**Table 1.3-1: Specifications**

| PARAMETER                               | SPECIFICATIONS                                     |
|-----------------------------------------|----------------------------------------------------|
| Passband: PCS                           | 1930 to 1990 MHz                                   |
| Optical Connectors                      | SC/APC                                             |
| Wavelength<br>Uplink Downlink           | 1550 nm $\pm$ 30 nm 1310 nm $\pm$ 30 nm            |
| Optical Output Power (at I-lth = 40 mA) | 0 dBm $\pm$ 2 dB typical                           |
| Optical Return Loss                     | > 40 dB                                            |
| LED Indicators                          | Green: Normal Operation<br>Other than Green: Alarm |

| PARAMETER                                                                                                             | SPECIFICATIONS                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**1.4 EUT Operating Configuration and Test Conditions**

The EUT was configured and tested utilizing the maximum input drive level resulting in maximum gain conditions for all tests. If the maximum input drive level is exceeded, internal attenuators are activated to produce a level RF output and eliminate the device from operating beyond the maximum RF output power that is below the saturated RF output power.

**2.0 TEST FACILITIES****2.1 Location**

The radiated and conducted emissions test sites are located at the following address:

Advanced Compliance Solutions  
5015 B.U. Bowman Drive  
Buford, GA 30518  
Phone: (770) 831-8048  
Fax: (770) 831-8598

**2.2 Laboratory Accreditations/Recognitions/Certifications**

The Semi-Anechoic Chamber Test Site, Open Area Test Site (OATS) and Conducted Emissions Site have been fully described, submitted to, and accepted by the FCC, Industry Canada and the Japanese Voluntary Control Council for Interference by information technology equipment. In addition, ACS is compliant to ISO 17025 as certified by the National Institute of Standards and Technology under their National Voluntary Laboratory Accreditation Program. The following certification numbers have been issued in recognition of these accreditations and certifications:

FCC Registration Number: 89450

Industry Canada Lab Code: IC 4175

VCCI Member Number: 1831

- VCCI OATS Registration Number R-1526
- VCCI Conducted Emissions Site Registration Number: C-1608

NVLAP Lab Code: 200612

## 2.3 Radiated Emissions Test Site Description

### 2.3.1 Semi-Anechoic Chamber Test Site

The Semi-Anechoic Chamber Test Site consists of a 20' x 30' x 18' shielded enclosure. The chamber is lined with Toyo Ferrite Grid Absorber, model number FFG-1000. The ferrite tile grid is 101 x 101 x 19mm thick and weighs approximately 550 grams. These tiles are mounted on steel panels and installed directly on the inner walls of the chamber.

The turntable is 150cm in diameter and is located 160cm from the back wall of the chamber. The chamber is grounded via 1 - 8' copper ground rod, installed at the center of the back wall, it is bound to the ground plane using 3/4" stainless steel braided cable.

The turntable is all steel, flush mounted table installed in an all steel frame. The table is remotely operated from inside the control room located 25' from the range. The turntable is electrically bonded to the surrounding ground plane via steel fingers installed on the edge of the turn table. The steel fingers make constant contact with the ground plane during operation.

Behind the turntable is a 3' x 6' x 4' deep shielded pit used for support equipment if necessary. The pit is equipped with 1 - 4" PVC chases from the turntable to the pit that allow for cabling to the EUT if necessary. The underside of the turntable can be accessed from the pit so cables can be supplied to the EUT from the pit.

A diagram of the Semi-Anechoic Chamber Test Site is shown in Figure 2.3-1 below:

Figure 2.3-1: Semi-Anechoic Chamber Test Site

### 2.3.2 Open Area Tests Site (OATS)

The open area test site consists of a 40' x 66' concrete pad covered with a perforated electro-plated galvanized sheet metal. The perforations in the sheet metal are 1/8" holes that are staggered every 3/16". The individual sheets are placed to overlap each other by 1/4" and are riveted together to provide a continuous seam. Rivets are spaced every 3" in a 3 x 20 meter perimeter around the antenna mast and EUT area. Rivets in the remaining area are spaced as necessary to properly secure the ground plane and maintain the electrical continuity.

The entire ground plane extends 12' beyond the turntable edge and 16' beyond the antenna mast when set to a 10 meter measurement distance. The ground plane is grounded via 4 - 8' copper ground rods, each installed at a corner of the ground plane and bound to the ground plane using 3/4" stainless steel braided cable.

The turntable is an all aluminum 10' flush mounted table installed in an all aluminum frame. The table is remotely operated from inside the control room located 40' from the range. The turntable is electrically bonded to the surrounding ground plane via steel fingers installed on the edge of the turn table. The steel fingers make constant contact with the ground plane during operation.

Adjacent to the turntable is a 7' x 7' square and 4' deep concrete pit used for support equipment if necessary. The pit is equipped with 5 - 4" PVC chases from the pit to the control room that allow for cabling to the EUT if necessary. The underside of the turntable can be accessed from the pit so cables can be supplied to the EUT from the pit. The pit is covered with 2 sheets of 1/4" diamond style reinforced steel sheets. The sheets are painted to match the perforated steel ground plane; however the underside edges have been masked off to maintain the electrical continuity of the ground plane. All reflecting objects are located outside of the ellipse defined in ANSI C63.4.

A diagram of the Open Area Test Site is shown in Figure 2.3-2 below:

Figure 2.3-2: Open Area Test Site

## 2.4 Conducted Emissions Test Site Description

The AC mains conducted EMI site is a shielded room with the following dimensions:

- Height: 3.0 Meters
- Width: 3.6 Meters
- Length: 4.9 Meters

The room is manufactured by Rayproof Corporation and installed by Panashield, Inc. Earth ground is provided to the room via an 8' copper ground rod. Each panel of the room is connected electrically at intervals of 4".

Power to the room is filtered to prevent ambient noise from coupling to the EUT and measurement equipment. Filters are models 1B42-60P manufactured by Rayproof Corporation.

The room is of sufficient size to test table top and floor standing equipment in accordance with section 6.1.4 of ANSI C63.4.

A diagram of the room is shown below in figure 2.4-1:

Figure 2.4-1: AC Mains Conducted EMI Site

## 3.0 APPLICABLE STANDARD REFERENCES

The following standards were used:

- 1 - ANSI C63.4-2003: Method of Measurements of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the 9KHz to 40GHz
- 2 - US Code of Federal Regulations (CFR): Title 47, Part 2, Subpart J: Equipment Authorization Procedures
- 3 - US Code of Federal Regulations (CFR): Title 47, Part 24, Subpart E: Broadband PCS

#### 4.0 LIST OF TEST EQUIPMENT

All test equipment used for regulatory testing is calibrated yearly or according to manufacturer's specifications.

Figure 6-1: EUT Test Setup

## 7.0 SUMMARY OF TESTS

Along with the tabular data shown below, plots were taken of all signals deemed important enough to document. Data plots can be found in the test report appendix 05-0458-24E-A.

### 7.1 RF Power Output

#### 7.1.1 Measurement Procedure

The RF output of the equipment under test was directly connected to the input of the Spectrum Analyzer. The resolution and video bandwidths of the spectrum analyzer were set at sufficient levels, >> emission bandwidth, to produce accurate results. The analyzer was set for Max Hold using a peak detector. Results are shown below in Table 7.1-1.

#### 7.1.2 Measurement Results

**Table 7.1-1: Peak Output Power**

| Modulation | Channel | Frequency (MHz) | RF Power Output (dBm) |
|------------|---------|-----------------|-----------------------|
| CDMA       | Low     | 1960.10         | 20.94                 |
| CDMA       | Middle  | 1931.35         | 20.82                 |
| CDMA       | High    | 1988.59         | 20.65                 |
| TDMA       | Low     | 1959.07         | 20.23                 |
| TDMA       | Middle  | 1930.07         | 20.32                 |
| TDMA       | High    | 1990.01         | 20.07                 |
| GSM        | Low     | 1930.20         | 20.42                 |
| GSM        | Middle  | 1960.00         | 19.79                 |
| GSM        | High    | 1989.80         | 19.84                 |

## 7.2 Occupied Bandwidth (Emission Limits)

#### 7.2.1 Measurement Procedure

The RF output of the equipment under test was directly connected to the input of the Spectrum Analyzer. The spectrum analyzer resolution and video bandwidths were set to 1% the emission bandwidth. The analyzer was set for Max Hold using a peak detector. Both the input and output bandwidths were evaluated to show similar characteristics of the emissions. Results for are shown below in Table 7.2-1.

#### 7.2.2 Measurement Results

Occupied bandwidth plots are listed below and are supplied in the test report appendix 05-0458-24E-A.

**Table 7.2-1: Occupied Bandwidth**

| Modulation | Channel | Frequency (MHz) | Plot Reference |
|------------|---------|-----------------|----------------|
| CDMA       | Middle  | 1960.0          | Figure 1.      |
| TDMA       | Middle  | 1958.9          | Figure 2.      |
| GSM        | Middle  | 1959.0          | Figure 3.      |

## 7.3 Spurious Emissions at Antenna Terminals and Inter-modulation Products

### 7.3.1 Measurement Procedure

The RF output of the equipment under test was directly connected to the input of the Spectrum Analyzer. For inter-modulation products the three tone method was used with the device operating at maximum drive levels. Three tones were placed at the lower band-edge and adjusted such that the third order harmonics were maximized and within the operating frequency band. Inter-modulation products were tested using TDMA, CDMA, and CW signals. CW covers FM (GSM and F1D) for inter-modulation products. The spectrum analyzer resolution and video bandwidths were set to 1% the emission bandwidth

For out of band spurious emissions the spectrum analyzer resolution and video bandwidths were set to 1 MHz according to Section 24.238 (b). The spectrum was investigated for the 30 MHz to 20 GHz in accordance to CFR 47 Part 2.1057. The analyzer was set for Max Hold using a peak detector. Spurious emissions were evaluated for all modulation modes.

### 7.3.2 Measurement Results

Emission plots are listed below in Table 7.3-1 and plots are supplied in the test report appendix 05-0458-24E-A.

**Table 7.3-1: Spurious Emissions**

| Modulation | Channel | Frequency Range (MHz) | Plot Reference |
|------------|---------|-----------------------|----------------|

## 7.4 Band-edge Compliance

### 7.4.1 Measurement Procedure

The RF output of the equipment under test was directly connected to the input of the Spectrum Analyzer. The spectrum analyzer resolution and video bandwidths were set to 1% the emission bandwidth. The analyzer was set for Max Hold using a peak detector. The center frequency was set to both the upper and lower cellular frequency block edges.

### 7.4.2 Measurement Results

Band-edge plots in are listed in Table 7.4-1 below and are supplied in the test report appendix 05-0458-24E-A.

**Table 7.4-1: Band-edge**

| Modulation | Channel | Frequency (MHz) | Plot Reference |
|------------|---------|-----------------|----------------|
| CDMA       | Low     | 1931.3          | Figure 27.     |
| CDMA       | High    | 1988.6          | Figure 28.     |
| TDMA       | Low     | 1930.1          | Figure 29.     |

| GSM        | Low     | 1930.2          | Figure 31.     |
| GSM        | High    | 1989.8          | Figure 32.     |

## 7.5 Field Strength of Spurious Emissions

### 7.5.1 Measurement Procedure

The equipment under test is placed on the Semi-Anechoic Chamber (described in section 2.3.1) on a wooden table at the turntable center. For each spurious emission, the antenna mast is raised and lowered from one (1) to four (4) meters and the turntable is rotated 360° and the maximum reading on the spectrum analyzer is recorded. This repeated for both horizontal and vertical polarizations of the receive antenna.

The equipment under test is then replaced with a substitution antenna fed by a signal generator. The signal generator's frequency is set to that of the spurious emission recorded from the equipment under test. The antenna mast is raised and lowered from one (1) to four (4) meters to obtain a maximum reading on the spectrum analyzer. The output of the signal generator is then adjusted until the reading on the spectrum analyzer matches that obtained from the equipment under test. The signal generator level is recorded.

The power in dBm of each spurious emission is calculated by correcting the signal generator level for the cable loss and gain of the substitution antenna referenced to a dipole. The spectrum was investigated in accordance to CFR 47 Part 2.1057. A CW was used for low, middle and high channels. The worst case emissions are reported. All emissions not reported were below the noise floor of the measurement equipment.

Results of the test are shown below in Table 7.5-1.

## 7.5.2 Measurement Results

**Table 7.5.-1: Field Strength of Spurious Emissions**

| Frequency (MHz) | Spectrum Analyzer Level (dBm) | Generator Level (dBm) | Antenna Polarity (H/V) | Correction Factors (dB) | Corrected Level (dBm) | Limit (dBm) | Margin (dB) |
|-----------------|-------------------------------|-----------------------|------------------------|-------------------------|-----------------------|-------------|-------------|

## 7.6 Frequency Stability - FCC Section 2.1055

The device performs no frequency translation therefore frequency stability requirements are not applicable.

## 7.7 Radiated Emissions (Unintentional Radiators) - FCC Section 15.109

### 7.7.1 Measurement Procedure

The equipment under test is placed on the Open Area Test Site (described in section 2.1) on a wooden table at the turntable center. For each radiated emission, the antenna mast is raised and lowered from one (1) to four (4) meters and the turntable is rotated 360° to obtain a maximum peak reading on the spectrum analyzer. The radiated emissions are then measured using an EMI receiver employing a CISPR quasi-peak detector for frequencies below 1000 MHz and an Average detector function for frequencies above 1000 MHz. This repeated for both horizontal and vertical polarizations of the receive antenna.

The field strength of each radiated emission is calculated by correcting the EMI receiver level for cable loss, amplifier gain, and antenna correction factors.

Field Strength (dBuV/m) = EMI Receiver Level (dBuV) + Cable Loss (dB) – Amplifier Gain (dB) + Antenna Correction Factor (1/m)

Results of the test are shown below in Table 7.7.-1.

**7.7.2 Measurement Results****Table 7.7-1: Radiated Emissions Tabulated Data**

| Frequency (MHz) | Uncorrected Reading (dB $\mu$ V/m) | Antenna Polarity (H/V) | Total Correction Factor (dB) | Corrected Reading (dB $\mu$ V/m) | Limit (dB $\mu$ V/m) | Margin (dB) |
