Test Report Number: 02F340B  
Model Designation: OMNI  
Product Description: Tag Verifier  
Marketing Approval \_\_\_\_\_

Description of non-standard test method or test practice: *None*

Estimated Measurement Uncertainty: *Not Applicable*

Special limitations of use: *None*

Traceability: *reference standards of measurement have been calibrated by a competent body using standards traceable to the NIST.*

According to testing performed at Product Safety Engineering, Inc., the above-mentioned unit is in compliance with the electromagnetic compatibility requirements defined in regulations indicated on page (3) of the test report. The test results contained herein relate only to the model(s) identified above. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical characteristics.

As the responsible EMC Project Engineer, I hereby declare that the equipment tested as specified above conforms to the requirements indicated on page (3) of the test report.

**Equipment Under Test (EUT) Test Operation Mode - Emission tests :**

**The device under test was operated under the following conditions during emissions testing:**

- Standby
- Test program (H - Pattern)
- Test program (color bar)
- Test program (customer specific)
- Practice operation
- Normal Operating Mode
- 

**Configuration of the device under test:**

- See System Under Test Information in Appendix B

**Rationale for EUT setup / configuration:**

EUT was in a normal operational mode during the testing. No peripherals were attached.

---

All measurements are made utilizing a quasi-peak detector unless otherwise indicated. All measurements were obtained utilizing CISPR recommended bandwidth settings.

### **Measurement Protocol**

The test methodology followed during the collection of the data included within this technical report was ANSI C63.4:1992.

The EUT was powered from internal battery during the collection of data included within.

The "unintentional radiator" data below is compared to the FCC Part 15 Class B "digital device" limits.

The "EMI" instrumentation is capable of calculating the final emission level based on the following formula:

Level at the receiver (dB $\mu$ V) + Antenna Correction Factor (dB/M) + Cable Loss (dB) - Preamp Gain (dB) = Actual Level in dB $\mu$ V/M.

The sample calculation below is based on the actual test data collected:

Observed Level		<b>52.1</b>	dB $\mu$ V	
ACF	+	<b>14.8</b>	dB/M	
Cable Loss	+	<b>1.7</b>	dB	
Preamp Gain	-	<b>26.0</b>	dB	
Actual Level		<b>42.6</b>	dB $\mu$ V/M	@ 300.4 MHz
