

3160 Compliance with FCC 2.815

The 3160 can only be driven from the Codan 2110 Transceiver and is controlled by a propriety data bus that checks for a digital signature at power on and if this is not received the 3160 will not power up.

All PA filter selection and PTT is software controlled from the connected 2110 transceiver so it is virtually impossible to control the 3160 without a 2110 transceiver.

The 2110 transceiver has a "CB Band " lock out feature where no frequency in the CB band will activate the 3160 Power Amplifier.

The 2110 transceiver has full FCC part 90 approval and its FCC ID is DYY2110.

Neil Abraham

A handwritten signature in cursive script that reads "Neil Abraham".
