TEST CONDITIONS

Power supply (V):

$$V_{\text{nominal}} = 5 \text{ Vdc}$$

Type of power supply = DC voltage through USB port of host computer.

Type of antenna = Integral antenna

TEST FREQUENCIES:

Lowest channel: 2402 MHz

Middle channel: 2448 MHz

Highest channel: 2479 MHz

The test set-up and procedure was made in accordance to the general provisions of ANSI C63.4-1992.

RADIATED MEASUREMENTS

All radiated tests were performed in a semi-anechoic chamber. The measurement antenna is situated at a distance of 3 m for the frequency range 30 MHz-1000 MHz (30 MHz-1000 MHz Bilog antenna) and at a distance of 1m for the frequency range 1 GHz-25 GHz (1 GHz-18 GHz Double ridge horn antenna and 18 GHz-40 GHz horn antenna).

For radiated emissions in the range 1 GHz-25 GHz that is performed at a distance closer than the specified distance, an inverse proportionality factor of 20 dB per decade is used to normalize the measured data for determining compliance.

The equipment under test was set up on a non-conductive (wooden) platform one meter above the ground plane and the situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

**Section 15.249 Subclause (a) and (d). Emission limitations radiated for harmonics
and outside of the specified frequency bands**

SPECIFICATION

The field strength of harmonics emissions from intentional radiators operated within the 902-928 MHz, 2400-2483.5, 5725-5875 MHz and 24.0-24.25 GHz shall comply the following:

Fundamental frequency	Field strength of Harmonics ($\mu\text{V/m}$)	Field strength of Harmonics ($\text{dB}\mu\text{V/m}$)
902-928 MHz	500	53.98
2400-2483.5 MHz	500	53.98
5725-5875 MHz	500	53.98
24.0-24.25 GHz	2500	67.96

Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50dB below the level of the fundamental or to the general radiated emission limits shown in Section 15.209, whichever is the lesser attenuation.

For frequencies above 1000 MHz the above field strength limits are based on average limits. The peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

RESULTS:

The situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

All tests were performed in a semi-anechoic chamber at a distance of 3 m for the frequency range 30 MHz-1000 MHz and at distance of 1m for the frequency range 1 GHz-25 GHz.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyser. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

Frequency range 30 MHz-1000 MHz.

Note: All emissions detected below 1 GHz are produced by the lap-top host computer.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

	Quasi-peak	Average
0,15 to 0,5	66-56	56-46
0,5 to 5	56	46
5 to 30	60	50
