NAME, MODEL, SERIAL # OF EUT:	Multicarrier Cellular Amplifier and Subrack, Model MCA9129-90, MCR4109-1

Electromagnetic Compatibility (EMC) Test Plan

1.0 EUT Documentation

This section provides the necessary documentation for detailing the Equipment Under Test (EUT). Descriptions of the equipment including software and documentation on installation and operations should be provided.

Additional documentation necessary for test plan completion should be attached to the back of the test plan. For additional instruction on how to complete your test plan contact your TÜV Product Service representative.

1.1 EUT Description: The MCA9129-90 is a linear, feed-forward power amplifier that operates in the 25 MHz frequency band from 889 MHz to 894 MHz. The amplifier can simultaneously transmit multiple frequencies, with better than -65 dBc third order intermodulation distortion (IMD). It is designed for use in an amplifier system that is modular in design, and is ideally suited for use in AMPS/TDMA/CDMA base stations. When used in a subrack employing four MCA9129-90 amplifiers, the system offers up to 360 watts output. The plug-in Model MCA9129-90 amplifier modules can each provide 100 watts of power and function completely independently of each other. The amplifier modules are designed for parallel operation to produce high peak power output and backup redundancy for remote applications. All solid-state, the system is designed to provide trouble-free operation with minimum maintenance. The system's modular construction and unique and highly effective LED-based operational status and fault indicators help minimize downtime. The turn-on and turn-off sequences of voltages are fully automatic, as is overload protection and recycling. Inadvertent operator damage from front panel manipulation is virtually impossible.

Each amplifier module has a status connector that allows the host system to monitor the amplifier module performance. The front panel of each amplifier module has unit level status/fault indicators and an RF on/off/reset switch. Primary power for the amplifier is +27 Vdc. Cooling for each plug-in amplifier module is provided by three fans, two mounted on the front and one on the rear of the module. The fans draw outside air through the front of the module and exhaust hot air out through the rear of the module.

The MCR4109-1 24-inch center-mount subrack contains an RF power splitter/combiner and a summary logic module that monitors the functional status of all plug-in amplifiers. The rear panel of the subrack interfaces with the host system via the system RF I/O connectors, an RF output sample connector, and a form C remote status connector to monitor the system. The system offers up to 360 watts output when four 100-watt amplifiers are employed. Primary power for the amplifier system is +27 Vdc, approximately 180 amps.

1.1.1 Components of EUT

(List each one separately. Add attachment if necessary. NOT TO INCLUDE PERIPHERALS.)

Description	Model Number	Serial Number	FCC ID Number

Electromagnetic Compatibility (EMC) Test Plan

1.2 Operating modes: (list and describe)

The MCA9129-80 amplifier operates in the 869-894MHz frequency range at an average output power of 100W per module stand-alone, or 80W per module when installed in the MCR4109-1 subrack, for a total possible output of 360W (if four amplifier modules are installed). It is capable of amplifying multiple carriers of CDMA, TDMA, or AMPS modulated input signals. The amplifier does not provide any modulation of its own.

1.3.3 Power requirements:

*Note: European power is typically 230 VAC 50Hz or 400 VAC 50Hz, single and three phase, respectively. FCC requires testing to be performed at typical US power ratings at 60Hz.

- 230 VAC 50Hz -- single phase Amps
- 400 VAC 50Hz -- three phase Amps per phase
- 120 VAC 60Hz -- single phase Amps
- +27 VDC 45-180 Amps
- Battery: VDC Expected life: Hours
- Other: (describe)

Report No. S9046-08 (FCC ID: E675JS0035)

1 GENERAL INFORMATION (continued)

1.2 Related Submittal/Grant

None

1.3 Tested System Details

The FCC IDs for all equipment, plus descriptions of all cables used in the tested system are:

None

1.4 Test Methodology

Purpose of Test: To demonstrate compliance with the ANSI C63.4 setup.

Test Performed:

- X 1. Conducted Emissions, FCC Part 2, Paragraphs 2.989, 2.991 and Part 22, Paragraph 22.816
- 2. Radiated Emissions EN55022: 1992 Class B limit, 30 - 1,000 MHz, 10 meters
- X 3. Radiated Emission per FCC Part 2, Paragraph 2.993, & Part 22, Paragraph 22.917
- 4. Engineering evaluations
- 5. Frequency Stability, Part 2, Paragraph 2.995, and Part 87, Paragraph 87.133
- X RF Output Power, Part 2, Paragraph 2.985, Part 22, Paragraph 22.917

Both Conducted and radiated testing were performed according to the procedures in FCC/ANSI C63.4 and CSA 108.8 - M1983. Radiated testing was performed at an antenna-to-EUT distance of 3 meters (1 - 10 GHz).

1.5 Test Facility

The open area test site and conducted measurement data were tested by:

TÜV PRODUCT SERVICE
10040 Mesa Rim Road
San Diego, CA 92121-2912
Phone: 619 546 3999
Fax: 619 546 0364

The Test Site Data and performance comply with ANSI 63.4 and are registered with the FCC, 7435 Oakland Mills Rd, Columbia Maryland 21046. All Measurement Data is acquired according to the content of FCC Measurement Procedure and ANSI C63.4, unless supplemented with additional requirements as noted in the test report.

1.6 Part 2 Requirements

Frequency range: 869 - 894 MHz

Rated RF output power: 100W per amplifier; 360W maximum (4 amplifiers in subrack)

Frequency tolerance: N/A

Emission Designators: F1D, F2D, F3D, F8W, F9W

Microprocessor model Number: N/A

Quantity production: Greater than 100 units

Types of emission: CDMA, TDMA, AMPS

Frequency range: 869 - 894 MHz

Range of operating power: 0 - 100 W

Maximum power rating: 100 W

Voltages and Currents applied: See Block Diagrams, section 4.1 and schematics.

Functions of active circuit devices: See Block Diagrams, section 4.1 and schematics.

Tune-up Procedure: User Manual Model MCR4109-1 section 3-3; User manual Model MCA9129-90, section 3-4.

Description of all circuitry and devices provided for determining and stabilizing frequency: Not applicable, EUT is a power amplifier.

Means for limiting spurious radiation: N/A; Means for limiting modulation: N/A; EUT is a power amplifier; Means for limiting power: the alarm logic controls the DC bias voltage which shuts down the amplifier on an input overpower condition.

Digital modulation techniques: N/A

Emissions Test Conditions: RADIATED EMISSIONS, FCC Part 2, Paragraph 2.993 and Part 22, Paragraph 22.917

The *RADIATED EMISSIONS* measurements were performed at the following test location :

- Test not applicable

■ - Canyon #2 (3- and 10-Meter Open Area Test Site), Carroll Canyon, San Diego

Testing was performed at a test distance of:

- 1 meters
- - 3 meters
- 10 meters

Test Equipment Used :

Model No.	Prop. No.	Description	Manufacturer	Serial No.	Cal Date
3115	453	Antenna, Double Ridge Guide	EMCO	9412-4363	10/03/99
3146	244	Antenna, Log Periodic Dipole	EMCO	1063	08/20/99
8566B	720	Spectrum Analyzer	Hewlett Packard	211500842	02/18/99
8566B	721	Spectrum Analyzer Display	Hewlett Packard	2112A02185	02/18/99

Remarks: _____

from the Spectrum Analyzer (Meter) Reading. In addition, a correction factor for the antenna , cable used and a distance factor, if any, must be applied to the Meter Reading before a true field strength reading can be obtained. In the automatic measurements and for greater efficiency and convenience, instead of using these correlation factors for each meter reading, the specification limit was modified to reflect these correlation factors at each frequency value so that the meter the "Corrected Meter Reading Limit" or simply the CMRL, which is the actual field strength present at the antenna. The quantity can be derived in the following manner:

Where, SAR = Spectrum Analyzer Reading
AF = Antenna Factor

AG = Amplifier Gain (if any)
DC = Distance Correction (if any)

dBuV was obtained from a Class A computing device measured at 83 MHz. Assume an antenna factor of 9.2 dB, a cable loss of 1.4 dB and amplifier gain of 20.0 dB at 83 MHz. The

$$\text{CMRL} = 29.4 \text{ dBuV} + 9.2\text{dB} = 1.4 \text{ dB} - 20 \text{ dB/M} - 0.0 \text{ dB}$$

dBuV/M

This result is well below the FCC and CSA Class A limit of 29.5

For the manual mode of measurement, a table of corrected meter reading limit was used to permit immediate comparison of the meter reading to determine if the measure emission amplitude exceeded the specification limit at that

GENERAL REMARKS:

SUMMARY:

All tests according to the standards cited on page 1 of this report.

■ - Performed

□ - **Not** Performed

The Equipment Under Test

■ - **Fulfills** the general approval requirements cited on page 1.

□ - **Does not** fulfill the general approval requirements cited on page 1.

- TÜV PRODUCT SERVICE, INC. -

Responsible Engineer:

Mary Washington
(EMC Engineer)
