INTERMODULATION

Test Conditions: Test performed using the three signal generator method. Data is taken in a 1MHz RBW using sample averaging with 100 samples. The display line is reverse mapped incorporating the correction factors of the high power attenuator and the directional coupler. All plots are taken in a 100MHz span. There are no intermodulation products outside of this range.

Test Conditions / Notes:

EUT is a power amplifier located on an 80cm table. The support equipment is located adjacent to the EUT. EUT input frequencies are chosen such that the lowest, middle and highest blocks are used. Three input signals are combined and fed to the EUT such that the output of the amplifier is set to 125W. EUT output is terminated through a high power attenuator to a power meter. The input signals are CDMA, which represents the worst case for spurious emissions. The input frequencies chosen are as follows: (Low) Block A: 1931.875, 1934.375 and 1943.125. (Mid) Block B: 1951.875, 1954.375 and 1963.125. (High) Block C: 1976.875, 1979.375 and 1988.125. Frequency Range investigated: 10MHz - 1GHz. Input frequencies are in Block A (Low Channel). For measurements within 1MHz of the block edge a 30kHz RBW was used. For all other measurements, 1MHz RBW was used. An extra 10dB of internal attenuation used between 10MHz and 1.5GHz to avoid compression and overload conditions.

Three input signals are combined and fed to the EUT such that the output of the amplifier is set to 125W. EUT output is terminated through a high power attenuator to a power meter. The input signals are CDMA, which represents the worst case for spurious emissions. The input frequencies chosen are as follows: (Low) Block A: 1931.875, 1934.375 and 1943.125. (Mid) Block B: 1951.875, 1954.375 and 1963.125. (High) Block C: 1976.875, 1979.375 and 1988.125. Frequency Range investigated: 1 - 20 GHz. Input frequencies are in Block B (Mid Channel). For measurements within 1MHz of the block edge a 30kHz RBW was used. For all other measurements, 1MHz RBW was used. An extra 10dB of internal attenuation used between 10MHz and 1.5GHz to avoid compression and overload conditions.

Three input signals are combined and fed to the EUT such that the output of the amplifier is set to 125W. EUT output is terminated through a high power attenuator to a power meter. The input signals are CDMA, which represents the worst case for spurious emissions. The input frequencies chosen are as follows: (Low) Block A: 1931.875, 1934.375 and 1943.125. (Mid) Block B: 1951.875, 1954.375 and 1963.125. (High) Block C: 1976.875, 1979.375 and 1988.125. Frequency Range investigated: 15MHz - 20GHz. Input frequencies are in Block B (Mid Channel). In the frequency range of 18-20GHz a test distance of 1 meter was used. No spurious emissions were found in this frequency range.
