§24.232 Power and antenna height limits.

(a) Base stations are limited to 1640 watts peak equivalent isotropically radiated power (e.i.r.p.) with an antenna height up to 300 meters HAAT. See 24.53 for HAAT calculation method. Base station antenna heights may exceed 300 meters with a corresponding reduction in power; see Table 1 of this section. **In no case may the peak output power of a base station transmitter exceed 100 watts.** The service area boundary limit and microwave protection criteria specified in §§24.236 and 24.237 apply.

Table 1: Reduced Power for Base Station Antenna Heights Over 300 Meters

HAAT in meters	Maximum E.I.R.P. (watts)
≤300	1640
≤500	1070
≤1000	490
≤1500	270
≤2000	160

The EUT is a RF amplifier. The manufacturer does not provide an antenna for sale with the product, hence EIRP is not measured nor calculated.

The RF power of the EUT was measured at the antenna port. The measurement satisfies the above requirement by demonstrating the measured power per channel is below 100 watts.

Test setup: The EUT is placed on the wooden table. The EUTs input ports are connected to a support signal amplifier and signal generator. The RF Output is connected to a RF load and a directional coupler. The RF power of the EUT is monitored at the output of the directional coupler and the RF input signal is adjusted to maintain the output power. RF Power = 200 watts.

Conclusion

As indicated above, each **single channel** does not exceed the 100 Watt peak power limit.

4.3 Mean Output power.

The EUT is a RF amplifier. The manufacture does not provide an antenna for sale with the product, hence EIRP is not measured nor calculated.

The RF power of the EUT was measured at the antenna port in accordance with RSS 131, 4.3.1 requirement.

Measured Po1 =+ 47.9. dBm

$$P \text{ mean} = Po1 + 3 \text{ dB} = 47.9 + 3 \text{ dBm} = 50.9 \text{ dBm} = 123 \text{ W}$$

Test Data

The internal control is adjusted to the nominal gain for which equipment certification is sought.

Testing the Future

With the aid of a signal generator and a spectrum analyzer, the 20 dB Bandwidth is measured.

The gain-versus-frequency response of the amplifier from the mid band Fo of the pass band up to at least $fo \pm 250\%$ of the 20dB Bandwidth.

Minimum standard:

The pass band gain response shall not exceed the nominal gain by more than 1 dB. The 20 dB bandwidth shall not exceed the nominal bandwidth that is stated by the manufacturer. Outside of the 20dB bandwidth the gain shall not exceed that at the 20dB point.
