The following is a statement of differences between our ARK501 Keypad Reader previously tested by CKC Labs and the FP5071-001 and FP5077-001 readers that you tested this week for our permissive change. There are three changes that have been to create the new models, the changes are as follows:

The physical keypad was changed from a membrane keypad to a telephone style metal keypad.

A new plastic enclosure was created to incorporate the new keypad into the reader.

The size of the readers antenna was increased to fit around the new keypad.

All other hardware and software remain the same as the original reader. I have attached a drawing of the new coil for inclusion.

(See attached file: coil.PDF)
