10-1-4 Initialization Sequence

Radio module initialize is necessary as being after the Vcc OC turned on.

- 1) Send data of PLL programmable reference divider. A width of PLL ENABLE of this case can apply CASE1 timing.
- 2) Send data of PLL programmable divider. A width of PLL ENABLE of this case can apply CASE1 timing.
- 3) Send data of PLL modes control register. A width of PLL ENABLE of this case must apply CASE2 timings.

10-1-5 Change of Channel

- 1) Send data of PLL programmable reference divider. A width of PLL ENABLE of this case must apply CASE2 timings.

10-1-6 Timing Chart (Please firstly send MSB.)

Description of changing signals:

For the radio module, the reference of the radio timing is the transmission of bit 0 (first bit of S-field) at its TX DATA input. This reference will be called B0.

Time slot N-1: Blind slot for synthesizer

- B000: Transfer synthesizer data for time slot N with PLL CLOCK and ENABLE.
RFON and PLL PWR DWN changes from low to high.
TX DATA changes from low to modulation center value.

- B442: TX DATA changes from modulation center value to low. ANT SW1 and ANT Sw2 changes from high to low RFON and PLL PWR DWN changes from high to low

Note 1(SYS CLOCK)

Sys clock (REF_CLK) is recommended to be continuously "always on".

Note 2(ANT SW1, 2)

ANT SW1, 2 is tied to TX/RX SWITCH "on" timing in transmit slot. In receive slot, ANT SW1, 2 will be active 5 bits after PLLPD "on".

ANT SWITCH 1	ANT SWITCH 2	Active antenna
L	L	Low current mode
H	L	ANT 1 active
L	H	ANT 2 active
H	H	Do not select this state.
