What is measurement uncertainty?

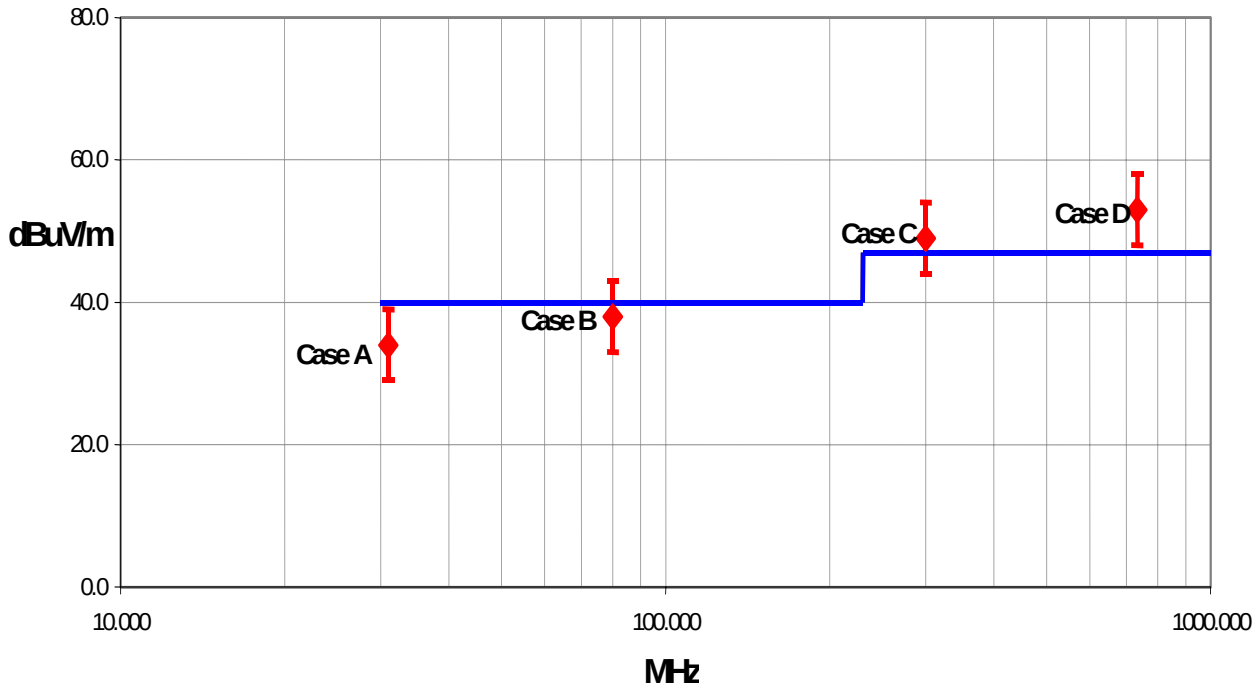
When a measurement is made, the result will be different from the true or theoretically correct value. The difference is the result of tolerances in the measurement system that cannot be completely eliminated. To the extent that technology allows us, it has been our aim to minimize this error. The following statement of measurement uncertainty is used to reflect the accuracy of the measured result as compared with its "true" value. In the case of transient tests (ESD, EFT, Surge, Voltage Dips and Interruptions), the test equipment has been demonstrated by calibration to provide at least a 95% confidence that it complies with the test specification requirements.

The following documents were the basis for determining the uncertainty levels of our measurements:

- "ISO Guide to the Expression of Uncertainty in Measurements", October 1993
- "NIS81: The Treatment of Uncertainty in EMC Measurements", May 1994
- "IEC CISPR 16-3 A1 f1 Ed.1: Radio-interference measurements and statistical techniques", December 2000

How might measurement uncertainty be applied to test results?

If the diamond marks the measured value for the test and the vertical bars bracket the range of + and – measurement uncertainty, then test results can be interpreted from the diagram below.



Test Result Scenarios:
Case A: Product complies.
Case B: Product conditionally complies. It is not possible to say with 95% confidence that the product complies.
Case C: Product conditionally does not comply. It is not possible to say with 95% confidence that the product does not comply.
Case D: Product does not comply.

$u_c(y)$ = square root of the sum of squares of the individual standard uncertainties

U = combined standard uncertainty multiplied by the coverage factor: **k**. This defines an interval about the measured result that will encompass the true value with a confidence level of approximately 95%. If a higher level of confidence is required, then k=3 (CL of 99.7%) can be used. Please note that with a coverage factor of one, uc(y) yields a confidence level of only 68%.

1	Spurious Radiated Emissions	05/17/2004	No EMI suppression devices were added or modified during this test.	Same configuration as delivered.	EUT was returned to client following testing.

Justification

The EUT is a Bluetooth radio module installed inside Intermec's mobile printer, Model 6820 (FCC ID: EHABTS080-1). The 6820 includes a docking station for Intermec's handheld computers, Models 700C and 730. With the hand-held scanners, the EUT contains co-located radio modules (CDMA , GSM, 802.11(b), and Bluetooth). This test demonstrates compliance with FCC 15.247(c) emissions limits while the EUT is co-located with the previously certified radios in the 700C (FCC ID: HN2SB555-2, HN22011B-2, EHA700C-SMC45-1, EHABTS080 for the CDMA, 802.11(b), GSM, and Bluetooth radios, respectively) and 730 hand-held computers (FCC ID: EHABTM210, EHA802CF13 for the Bluetooth and 802.11(b) radios, respectively). Each radio transmits through its own antenna.

All possible combinations of harmonic emissions from the CDMA, 802.11(b), GSM, and Bluetooth radios were compared numerically. Test Description

Requirement: Per 15.247(c), the field strength of any spurious emissions or modulation products that fall in a restricted band, as defined in 15.205, is measured. The peak level must comply with the limits specified in 15.35(b). The average level (taken with a 10Hz VBW) must comply with the limits specified in 15.209.

Configuration for Simultaneous Transmission: The EUT is an Bluetooth radio module installed inside Intermec's mobile printer, Model 6820 (FCC ID: EHABTS080-1). The printer can have co-located radio modules when an Intermec Handheld Computer, 700C or 730, is installed in the docking station. The 700C (FCC ID: HN2SB555-2, HN22011B-2, EHA700C-SMC45-1, EHABTS080 for the CDMA, 802.11(b), GSM, and Bluetooth radios, respectively) and 730 (FCC ID: EHABTM210, EHA802CF13 for the Bluetooth and 802.11(b) radios, respectively) have been previously certified. With a handheld computer installed in the printer, the Bluetooth radio module can simultaneously transmit with four other co-located radios (CDMA, GSM, Bluetooth, and 802.11(b)). This test demonstrates compliance with FCC 15.247(c) emissions limits while the EUT is co-located with another previously certified mobile radio. The EUT can transmit simultaneously with CDMA, 802.11(b), and Bluetooth or with GSM, 802.11(b), and Bluetooth in the 700C, and it can transmit simultaneously with 802.11(b) and Bluetooth in the 730. Each radio transmits through its own antenna.

The following is an excerpt from the FCC / TCB Training Q & A, October 2002, Day 2, Question 7:

> **Assuming that the radios do not share an antenna, only radiated tests for simultaneous transmission is required. If the radios share an antenna, antenna conducted measurements would also be required. Only one set of worst case simultaneous transmission data is going to be requested to be submitted at this time. The test engineer should indicate the worst case condition and provide justification as to why the worst case condition was chosen. The grantee should be reminded that even if the FCC requests one set of data, they are responsible for compliance for all modes of simultaneous transmission.**

All possible combinations of harmonic emissions from the CDMA, 802.11(b), GSM, and Bluetooth radios were compared numerically. It was determined that there were no possible coincidental harmonics below 1 GHz. The frequency range from 1 GHz to 26 GHz was investigated for channel combinations that would produce coincidental harmonics. Compliance with the restricted band at 2483.5 – 2500 MHz was also measured.

All the radios were configured for simultaneous transmission at the channels specified in the previous pages. The highest gain antennas to be used with the radios were tested. The spectrum was scanned throughout the specified range. While scanning, emissions from the radios were maximized by rotating the EUT on a turntable, adjusting the position of the EUT and EUT antennas in three orthogonal axes, and adjusting the measurement antenna height and polarization (per ANSI C63.4:2001). A preamp and high pass filter were used for this test in order to provide sufficient measurement sensitivity.
