Standard	*	47 CFR FCC Part 15.255

The product was received on Mar. 10, 2020, and testing was started from Mar. 23, 2020 and completed on Apr. 29, 2020. We, SPORTON INTERNATIONAL INC. EMC & Wireless Communications Laboratory, would like to declare that the tested sample has been evaluated in accordance with the procedures given in ANSI C63.10-2013, 47 CFR FCC Part 15.255, Millimeter Wave Test Procedures, FCC KDB 414788 D01 v01r01 and shown compliance with the applicable technical standards.

The report must not be used by the client to claim product certification, approval, or endorsement by TAF or any agency of government.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC. EMC & Wireless Communications Laboratory, the test report shall not be reproduced except in full.

# **Summary of Test Result**

#### **Declaration of Conformity:**

The test results with all measurement uncertainty excluded are presented in accordance with the regulation limits or requirements declared by manufacturers.

#### **Comments and Explanations:**

The declared of product specification for EUT presented in the report are provided by the manufacturer, and the manufacturer takes all the responsibilities for the accuracy of product specification.

#### 3.1.2 Measuring Instruments

Refer a measuring instruments list in this test report.

#### 3.1.3 Test Procedures

Method of measurement: Refer as ANSI C63.10-2013, clause 6.2.

#### 3.1.4 Test Setup

1—Interconnecting cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center forming a bundle 30 cm to 40 cm long.

2—The I/O cables that are not connected to an accessory shall be bundled in the center. The end of the cable may be terminated, if required, using the correct terminating impedance. The overall length shall not exceed 1 m.

3—EUT connected to one LISN. Unused LISN measuring port connectors shall be terminated in 50  $\Omega$  loads.

LISN may be placed on top of, or immediately beneath, reference ground plane.

3.1—All other equipment powered from additional LISN(s).

3.2—A multiple-outlet strip may be used for multiple power cords of non-EUT equipment.

3.3—LISN at least 80 cm from nearest part of EUT chassis.

4-Non-EUT components of EUT system being tested.

5—Rear of EUT, including peripherals, shall all be aligned and flush with edge of tabletop.

6—Edge of tabletop shall be 40 cm removed from a vertical conducting plane that is bonded to the ground plane.

7—Antenna can be integral or detachable. If detachable, then the antenna shall be attached for this test.

#### 3.1.5 Test Result of AC Power Conducted Emissions

Test Conditions	see ANSI C63.10, clause 5.11
Test Setup	see ANSI C63.10, clause 6.2.3
NOTE 1: If equipm	ent having different channel plan and nominal channel bandwidth modes (see test report
clause 1.	1.1), the measurements are uninfluenced by different channel plan and nominal channel
bandwidth	n modes, may not need to be repeated for all modes. If equipment having different
transmit o	operating modes (see test report clause 1.1.2), the measurements are uninfluenced by
different t	transmit operating modes, may not need to be repeated for all the operating modes.
Similar, if	the equipment supports different modulations and/or data rates, the measurements
described	I in ANSI C63.10, clause 5.12 may not need to be repeated for all these modulations and
data rates	s. Simple comparison of engineering test across all operating modes, modulations and
data rates	s may need to be performed to define the worse case combination to be used for the
conforma	nce testing.
NOTE 2: ">20dB"	means the tables in this clause should only list values of spurious emissions that exceed
the level of	of 20 dB below the applicable limit, see ANSI C63.4, clause 10.1.8.1.

# 3.2 Occupied Bandwidth

### 3.2.1 Limit of Occupied Bandwidth

6dBc Bandwidth (see Note 1)	None
99% Occupied Bandwidth (see Note 2)	None
NOTE 1: The 6dBc bandwidth is the frequency band	dwidth of the signal power at the -6 dBc points when
measured with a 100 kHz resolution bandwi	dth. These measurements shall also be performed at
normal test conditions.	
NOTE 2: The 99% occupied bandwidth is the frequer	ncy bandwidth of the signal power at the 99% channel
power of occupied bandwidth when resolution	on bandwidth should be approximately 1 % to 5 % of
the occupied bandwidth (OBW). These me	easurements shall also be performed at normal test
conditions.	

### 3.2.2 Measuring Instruments

Refer a measuring instruments list in this test report.

#### 3.2.3 Test Procedures

Method of measurement: Refer as ANSI C63.10-2013, clauses 6.9.2.

# 3.2.4 Test Setup

# 3.2.5 Test Result of Occupied Bandwidth

Test Conditions	see ANSI C63.10, clause 5.11
Test Setup	see ANSI C63.10, clause 6.9.2
NOTE: If equipment	ent having different transmit operating modes (see test report clause 1.1.2), the
measurer	nents are uninfluenced by different transmit operating modes, may not need to be
repeated	for all the operating modes. Similar, if the equipment supports different modulations
and/or da	ta rates, the measurements described in ANSI C63.10, clause 5.11 may not need to be
repeated	for all these modulations and data rates. Simple comparison of engineering test across
all operat	ing modes, modulations and data rates may need to be performed to define the worse
case com	bination to be used for the conformance testing. Refer as ANSI C63.10, clause 15,
observe a	and record with plotted graphs or photographs the worst-case (i.e., widest) occupied
bandwidth	n produced by these different modulation sources.

The measured Level is calculated using:

Corrected Reading: Antenna Factor + Cable Loss + Read Level - Preamp Factor = Level.

### 3.5.5.1 Test Result of Transmitter Spurious Emissions (Below 30MHz)

There is a comparison data of both open-field test site and alternative test site - semi-Anechoic chamber according to KDB414788 Radiated Test Site, and the result came out very similar.

All amplitude of spurious emissions that are attenuated by more than 20 dB below the permissible value has no need to be reported.

The radiated emissions were investigated from 9 kHz or the lowest frequency generated within the device, up to the 10 harmonic or 40 GHz, whichever is appropriate.

Test Range	40GHz – 200GHz

Test Frequency (GHz)	Rx Antenna Gain (dBi)	Measurement Distance (m)	Read Worse Frequency (GHz)	Read Level (dBm)
60.485	23.6	0.50	51.95	-77.88
EIRP (dBm)	Specification Distance (m)	Power Density (pW/cm^2)	Limit (pW/cm^2)	Test Result
-40.75	3	0.0745	90	PASS

Note:

EIRP = Prx - Grx + Free Space Path Loss = Prx - Grx +  $20Log(4\pi d/\lambda)^2$ 

Which

Prx = Read Level.

Grx = Rx Antenna Gain.

A distance factor is offset and the formula is 20LOG(D1/D2)

Which

D1 = Specification Distance

D2 = Measurement Distance

# 3.6 Frequency Stability

#### 3.6.1 Limit of Frequency Stability

Frequency Stability	Limit					
Refer as FCC 15.255(f) and	within the frequency bands					
ANSI C63.10-2013, clause 9.14	within the frequency bands					
Note: These measurements shall also be performed at normal and extreme test conditions.						

#### 3.6.2 Measuring Instruments

Refer a measuring instruments list in this test report.

#### 3.6.3 Test Procedures

Method of measurement: Refer as ANSI C63.10-2013, clauses 9.14.

#### 3.6.4 Test Setup

#### 3.6.5 Test Result of Frequency Stability

**Test Conditions** see ANSI C63.10, clause 5.11 & clause 9

Test Setup see ANSI C63.10, clause 9.14

NOTE: If equipment having different channel plan and nominal channel bandwidth modes (see test report clause 1.1.1), the measurements are uninfluenced by different channel plan and nominal channel bandwidth modes, may not need to be repeated for all modes.

#### 3.6.5.1 Frequency Stability with Respect to Ambient Temperature

Frequency Stability with Respect to Ambient Temperature

20	60.895	Reference	Within band					
30	60.896	1	Within band					
35	60.896	1	Within band					
NOTE: The manufacturer's specifi	ed temperature range of 5 t	to 35°C.						

### 3.6.5.2 Frequency Stability When Varying Supply Voltage

Frequency Stability When Varying Supply Voltage

# 3.7 Operation Restriction and Group Installation

# 3.7.1 Limit of Operation Restriction and Group Installation

Item	Limit					
	Operation is not permitted for the following products:					
	• Equipment used on aircraft or satellites. (Refer as FCC 15.255 (a))					
Operation Restriction	• Field disturbance sensors, including vehicle radar systems, unless the field					
	disturbance sensors are employed for fixed operation. (Refer as FCC					
	15.255 (a))					
	Operation is not permitted for the following products:					
Group Installation	External phase-locking (Refer as FCC 15.255 (h))					

### 3.7.2 Result of Operation Restriction

Manufacturer declares that EUT will not been used on aircraft or satellites. Then user manual will include a statement to caution EUT is not permitted for used on aircraft or satellites. EUT is a wireless video area network (WVAN) for the connection of consumer electronic (CE) audio and video devices.

# 3.7.3 Result of Group Installation

The frequency, amplitude and phase of the transmit signal are set within the EUT. There are no external phase-locking inputs or any other means of combining two or more units together to realize a beam-forming array.
