3. EUT modification under the test

The following countermeasures were implemented for the radiated emission.

- ① The electro conductive cloth was add to the internal DC cable.
- ② The ferrite core was add to the internal DC cable.
- ③ The electro-conductive cloth was added to the position between the DC cable and the Modem module.

4. Measurement procedure and test equipment

The measurement was performed without deviation from CISPR22 (2005)

4.1 Radiated emission

4.1.1 Radiated emission (30MHz~1,000MHz)

The EUT was set on the 80 cm height desk placed on the turntable in the 10 m RF semi-anechoic chamber.

The PC-2, PC3 and HUB were placed at outside of the chamber to make usual install condition at the different place. The maximum noise level in the frequency range from 30 MHz to 1,000 MHz were measured by 10 m method with scanning the antenna height from 1 m to 4 m above the ground plane and rotating the EUT through 360 degrees for both horizontal and vertical polarization.

Preliminary measurement using spectrum analyzer peak detection was performed to arrange the minimum margin spectrum. The settings of the interface cables and the mouse were adjusted to obtain maximum level at the minimum margin spectrum. The final measurement was performed using the RFI receiver (CISPR Quasi-peak, 120 kHz band width) and calibrated broadband antennas or dipole antennas about the main spectrums that was obtained by the preliminary measurement.

4.1.2 Radiated emission (1 GHz~6.5 GHz)

The EUT was set on the 80 cm height non-reflective desk on the turntable. The radiated emission measurement from 1 GHz to 6.5 GHz: Operating rate 1.3 GHz was performed using the spectrum analyzer (Peak detection, 1MHz band width) and the horn antenna that was positioned at 3 m from the EUT for class B. The measurement was performed with rotating the EUT through 360 degrees and fixing the antenna height to the 1 m for both horizontal and vertical polarization.

4.2 AC power line conducted emission

The conducted emission measurement was performed using the 50Ω/50μH artificial mains network: AMN in the shielded room. The EUT was set on the 80 cm height wooden desk and operated by AC 100 V/ 50 Hz, AC 120 V/ 60 Hz and AC 230 V/ 50 Hz. Preliminary measurement using spectrum analyzer peak detection was performed in the frequency range from 150 kHz to 30 MHz to arrange the minimum margin spectrum. The setting of the cables was adjusted to obtain maximum level at the minimum margin spectrum. The final measurement was performed using the RFI receiver (CISPR Quasi-peak, 9 kHz band width) and recorded the maximum value in the monitored interval about the main spectrum that was obtained by the preliminary measurement.

4.3 Telecommunication line conducted emission

The conducted emission measurement was performed using the impedance stabilization network: ISN LCL; 55 dB for telecom port, current probe for shielded LAN port in the shielded room. The EUT was set on the 40 cm height wooden desk and operated by AC 230 V/ 50 Hz. Preliminary measurement using spectrum analyzer peak detection was performed in the frequency range from 150 kHz to 30 MHz to arrange the minimum margin spectrum.
