## C. 2 Power Limits. Maximum Output power \& Peak power spectral density

## Test limits:

| FCC part | Limits |
| :--- | :--- |
|  | For the 5.25-5.35 GHz and 5.47-5.725 GHz bands, the <br> maximum conducted output power over the frequency |
| 15.407 <br> bands of operation shall not exceed the lesser of 250 mW |  |
| (a) (2) | or 11 dBm + 10 log B, where B is the 26 dB emission <br> bandwidth in megahertz. In addition, the peak power <br> spectral density shall not exceed 11 dBm in any 1 <br> megahertz band. |

## Test procedure:

The Maximum Conducted Output Power was measured using the channel integration method according to point E) 2) e) (Method SA-2 Alternative) of KDB 789033 D02.

The maximum power spectral density (PSD) was measured using the method according to point F) (Method SA-2 Alternative) of KDB 789033 D02.

In the measure-and-sum approach for MIMO mode, the conducted emission level (e.g., transmit power or power in specified bandwidth) is measured at each antenna port. The measured results at the various antenna ports are then summed mathematically in linear power units to determine the total emission level from the device.

The EIRP power (dBm) is calculated by adding the declared maximum antenna gain to the measured conducted power.

The setup below was used to measure the maximum conducted output power and power spectral density. The antenna terminal of the EUT is connected to the spectrum analyzer through an attenuator, and the spectrum analyzer reading is compensated to include the RF path loss.

The declared maximum antenna gain is 5 dBi .

## Results tables:

| MIMO modes - Combined results |  |  |  |  | Power [dBm] |  |  |  |

## C. 3 Undesirable emissions limits: Band Edge (conducted)

## Test limits:

| FCC part | Limits |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $15.407 \text { (b) }$ <br> (2) | For transmitters operating in the $5.25-5.35 \mathrm{GHz}$ band: all emissions outside of the $5.15-5.35 \mathrm{GHz}$ band shall not exceed an EIRP of -27 $\mathrm{dBm} / \mathrm{MHz}$. |  |  |  |
| 15.209 | Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a): |  |  |  |
|  | Freq Range (MHz) | $\begin{gathered} \text { Field Stregth } \\ (\mu \mathrm{V} / \mathrm{m}) \end{gathered}$ | Field Stregth ( $\mathrm{dB} \mu \mathrm{V} / \mathrm{m}$ ) | Meas. Distance |
|  | 0.009-0.490 | 2400/f(kHz) |  | 300 |
|  | 0.490-1.705 | 24000/f(kHz) |  | 300 |
|  | 1.705-30.0 | 30 |  | 30 |
|  | 30-88 | 100 | 40 | 3 |
|  | 88-216 | 150 | 43.5 | 3 |
|  | 216-960 | 200 | 46 | 3 |
|  | Above 960 | 500 | 54 | 3 |
|  | The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9$90 \mathrm{kHz}, 110-490 \mathrm{kHz}$ and above 1000 MHz . Radiated emission limits in these three bands are based on measurements employing an average detector. <br> For average radiated emission measurements above 1000 MHz , there is also a limit specified when measuring with peak detector function, corresponding to 20 dB above the indicated values in the table. |  |  |  |

## Test procedure:

The setup below was used to measure undesirable emissions on the Band Edge domain. The antenna terminal of the EUT is connected to the spectrum analyzer through an attenuator, and the spectrum analyzer reading is compensated to include the RF path loss and the declared Antenna Gain.

The Band Edge High, was measured using the method according to point G) 3) d) (ii) (Integration Method) of KDB 789033 D02. This measurement performs a band-power integration across the 1 MHz in which the band-edge emission level has to be measured

In case of Band Edge measurements falling in restricted bands, the declared Antenna Gain is also compensated in the graph.

The declared maximum antenna gain is 5 dBi .

The following limits in dBm were applied for the average detector after the conversion from the limits detailed above in $\mathrm{dB} \mu \mathrm{V} / \mathrm{m}$, according to FCC 47 CFR part 15 - Subpart C - §15.209(a). The limits in dBm for peak detector are 20 dB above the indicated values in the table.

| $\S 15.209(\mathrm{a})$ |  |  | Converted values |  |

## Test procedure:

The below setups were used to measure the radiated spurious emissions.
Depending of the frequency range and bands being tested, different antennas and filters were used.
The final measurement is done by varying the antenna height, the EUT azimuth over $360^{\circ}$ and for both Vertical and Horizontal polarizations.
The radiated spurious emissions were measured on the worst case configuration selected from the chapter C. 2 and using the lowest, middle and highest channels.

Radiated Setup < 1GHz

Radiated Setup $18 \mathrm{GHz}-26.5 \mathrm{GHz}$

Radiated Setup > 26.5 GHz

## Test Results:

## Radiated Spurious - 30MHz to $\mathbf{1 G H z}$

## Radiated Spurious - All modes

Note 1: The spurious signals detected do not depend on either the operating channel or the modulation mode.

Note 1: The spurious signals detected do not depend on either the operating channel or the modulation mode.

## Annex D. Test Results U-NII-2C

## D. 1 26dB \& 99\% Bandwidth

## Test procedure:

The setup below was used to measure the 26 dB \& $99 \%$ Bandwidth. The antenna terminal of the EUT is connected to the spectrum analyzer through an attenuator, and the spectrum analyzer reading is compensated to include the RF path loss.

For the overlapped channels between U-NII-2C and U-NII-3 bands, and according to FCC KDB 644545 D03, the boundary frequency between the bands is used as one edge for defining the portion of the 26 dB BW that falls within a particular U-NII band. This rule is only applicable for the 26 dB BW and for those channels marked as overlapped.

Results tables:

| Mode | Rate | Antenna | Channel | Frequency [MHz] | $\begin{gathered} \text { 26dB BW } \\ \text { [MHz] } \end{gathered}$ | $\begin{gathered} \text { 99\% BW } \\ {[\mathrm{MHz}]} \end{gathered}$ |
