

To Whom It May Concern:

Here are the answers to the questions in FCC correspondence number 35019.

- 1) The device is intended for installation in a utility vehicle which drives around activating remote stations (using the MAS frequencies; 952-960 MHz) in order to receive data from them (receiving in the ISM band; 902-928 MHz). Therefore it is both a "Master Station and a "Mobile Station". The 14 dBW limit applies because it is used in a mobile application.
- 2) An updated test report has been provided which includes the proper limit and EIRP.

Corrective actions:

- 1) The test report has been updated.
- 2) Antenna information has been included for reference.

All best

CKC Certification Services.
