

## STX-1550C

The STX-1550C remote control is a Crestron radio-frequency (RF) 2-way wireless touchpanel that is designed for numerous applications ranging from the boardroom to complete home automation. Electronic devices or subsystems can be controlled from anywhere via the wireless user interface. Users are no longer tethered by a wired control panel or limited to infrared line-of sight control, as with most ordinary wireless controllers.

The STX-1550C RF, 2-way wireless transceiver will communicate through a RF gateway/transceiver, STRFGWX to the Cresnet system. The 2-way communications provide the control of the Cresnet devices and provide dynamic onscreen feedback for real-time confirmation of commands.
