## Section 1. Summary of Test Results

Manufacturer: Bosch Security Systems

Model No.: DS840LSN

Serial No.: Sample No. 1

General: All measurements are traceable to national standards.

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 15, Subpart C, Paragraph 15.245. All tests were conducted using measurement procedure ANSI C63.4-1992. Radiated emissions are made on an open area test site. A description of the test facility is on file with the FCC.

) ( )

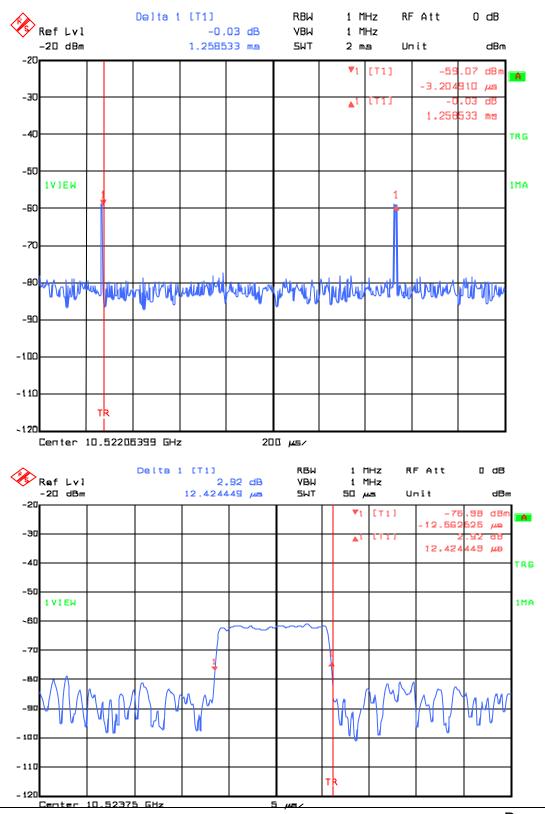

The transmitter pulses once every 1.25 msec. Each pulse is 12.4 microseconds (.0124 msec.)

The pulse repetition frequency is 1/1.25 msec. = .8 kHz In any 100 msec. period there are 100/1.25 = 80 pulses. The maximum rf on-time is therefore:

20 Log(80 x .0124msec./100msec.) = -40 dB

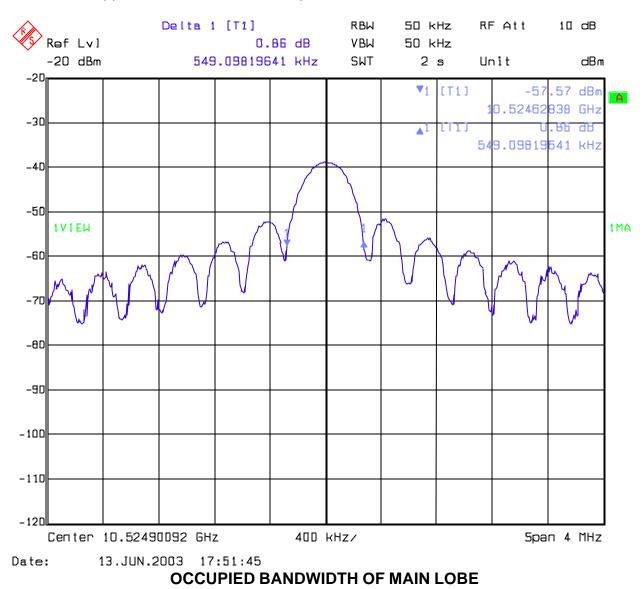

## FCC PART 15, SUBPART C INTENTIONAL RADIATORS USED AS FIELD DISTURBANCE SENSORS PROJECT NO.: 3L0107RUS1

EQUIPMENT: DS840LSN

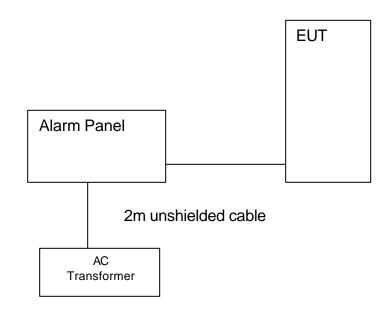

#### Description of E.U.T.

The EUT is a microwave motion detector operating at 10.525 GHz. The detector operates on 12 Vdc supplied from an alarm control panel.

NAME OF TEST: Radiated Emissions	PARA. NO.: 15.245
TESTED BY: Tom Tidwell	DATE: 26 May, 2003

Minimum Standard:

See Annex B

Test Results:

**Test Data:** See attached table.

Above 1 GHz a spectrum analyzer and low noise amplifier are used to measure emission levels. The spectrum analyzer resolution bandwidth was set to 1 MHz and video bandwidth was 1 MHz.

Complies.

In the case of handheld equipment, the E.U.T. is rotated in three planes to obtain worst-case results.

## Section 5. Powerline Conducted Emissions

NAME OF TEST: Powerline Conducted Emissions	PARA. NO.: 15.207
TESTED BY: T. Tidwell	DATE: 7/25/03

#### Minimum Standard:

Frequency (MHz)	Maximum Powerline Conducted RF Voltage					
	Average (dB?V)	Quasi-Peak (dB?V)				
.1505	57	67				
.5 – 5	47	57				
5-30	50	60				

**Test Results:** Complies. See attached graphs and table.

**Test Data:** See attached table and graphs.

#### Method Of Measurement: (Procedure ANSI C63.4-1992)

Measurements were made using a spectrum analyzer with 9 kHz RBW, Peak detector. Any emissions that are close to the limit are measured using a test receiver with 9 kHz bandwidth, CISPR Quasi-Peak detector.

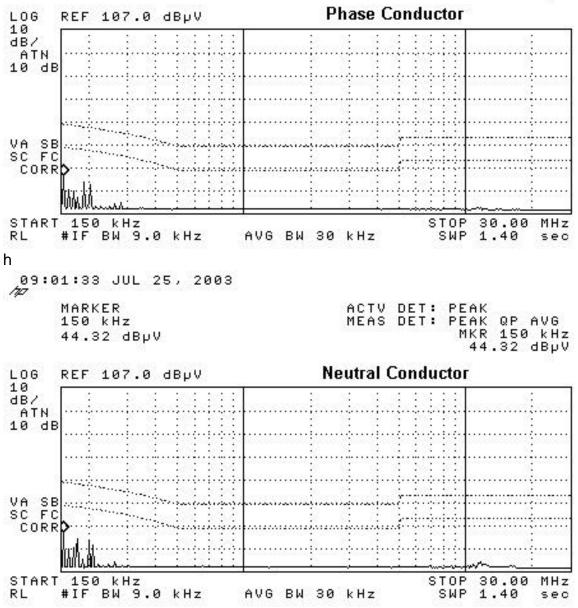

Broadband emissions are identified by switching the receiver detector function from Quasi-Peak to Average. If the amplitude of the emission drops by 6 dB or more then the emission is classified as broadband and the Quasi-Peak level is reduced by a factor of 13 dB.

All emissions within 10 dB of limit have been recorded.

# **Annex B - Radiated Emission Limits**

#### **Radiated Emission Limits**

# §15.245 Operation within the bands 902-928 MHz, 2435-2465 MHz, 5785-5815 MHz, 10500-10550 MHz and 24075-24175 MHz.

- (a) Operation under the provision of this section is limited to intentional radiators used as field disturbance sensors, excluding perimeter protection systems.
- (b) The field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following:

Fundamental Frequency (MHz)	Field Strength Of Fundamental (millivolts/meter)	Field Strength of Harmonics (millitvolts/meter)
902-928	500	1.6
2435-2465	500	1.6
5785-5815	500	1.6
10500-10550	2500	25.0
24075-24175	2500	25.0

- (1) Regardless of the limits shown in the above table, harmonic emissions in the restricted bands below 17.7 GHz, as specified in §15.205, shall not exceed the field strength limits shown in §15.209. Harmonic emissions in the restricted bands at and above 17.7 GHz shall not exceed the following field strength limits:
  - (i) For field disturbance sensors designed for use only within a building or to open building doors, 25 mV/m.
  - (ii) For all other field disturbance sensors, 7.5 mV/m.
  - (iii) Field disturbance sensors designed to be used in motor vehicles or aircraft must include features to prevent continuous operation unless their emissions in the restricted bands fully comply with the limits given in §15.209. Continuous operation of field disturbance sensors designed to be used in farm equipment; vehicles such as fork-lifts that are intended primarily for use indoors or for very specialized operations. Or railroad locomotives, railroad cars and other equipment which travel on fixed tracks is permitted. A field disturbance sensor will be considered not to be operating in a continuous mode if its operation is

limited to specific activities of limited duration (e.g. putting a vehicle in reverse gear, activating a turn signal, etc.).

#### §15.245, continued

- (2) Field strength limits are specified at a distance of 3 meters.
- (3) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209, whichever is the lesser attenuation.
- (4) The emission limits shown above are based on measurement instrumentation employing an average detector. The provisions in §15.35 for limiting peak emissions apply.

#### §15.209 Radiated Emission Limits, General Requirements

(a) Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field Strength (millivolts/meter)	Measurement Distance (meters)
0.009-0.490	2400/F (kHz)	300
0.490-1.705	2400/F (kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3
