## 5.5. Restricted Bands Radiations (9kHz – 25GHz)

### 5.5.1 Test Procedure [ FCC 15.205/209 , IC 6.2.1/6.3 ]

Radiated emission measurements are performed at 3m distance with the broadband antenna (Loop antenna, Biconical antenna, log-periodic antenna and double-ridged guide antenna). The antenna is positioned both the horizontal and vertical planes of polarization and height is varied 1 to 4 meters and stopped at height producing the maximum emission. As for the Loop antenna, it is positioned with its plane vertical, and the center of the Loop is 1.0meter above the ground plane. Frequency Range: 9kHz –1GHz is scanned and investigated with the test receiver, and above 1GHz, with the spectrum analyzer. The detector function of the test receiver is set to CISPR Quasi-peak mode and the bandwidth is set to 120kHz. Peak and average detectors are used for measurements above 1GHz. The bandwidth of the spectrum analyzer is set to 1MHz.

The EUT and support equipment are placed on a 1 meter x 2.3meter surface, 0.8meter height wooden table. The turntable is rotated by 360 degrees and stopped at azimuth of producing the maximum emission.

Interconnecting cables, which hanging closer than 40cm to the horizontal metal ground plane are bundled its excess in center. The highest frequency generated in the EUT is 2483.5MHz, therefore the frequency was investigated up to 25GHz, as specified in CFR section 15.33, and at least six highest emissions are reported. The test results represent the worst-case emission for each emission with manipulating the EUT, support equipment, interconnecting cables and varying the mode of operation.

Sufficient time for the EUT, support equipment, and test equipment are allowed in order for them to warm up to their normal operating condition.

1. The lower limit shall apply at the transition frequencies.
2. Emission level [dBuV/m] = 20 log Emission [uV/m]
3. As shown in 15.35(b), for frequencies above 1000MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20dB under any condition of modulation.

#### 5.5.4 Sample of field strength calculation

Radiated Emission  $\text{dB } \mu\text{V/m} = 20\log_{10} (\mu\text{V/m})$

<b>Class B</b>
Limit @147.6MHz = 150 $\mu\text{V/m}$ = 43.5dB $\mu\text{V/m}$
Reading = 42.8dB $\mu\text{V}$ Ant. Factor + Cable Loss - Amp. Gain = 14.2 + 3.0 - 30.0 = -12.8dB Total = 42.8 - 12.8 = 30.0dB $\mu\text{V/m}$
Margin = 43.5 - 30.0 = <u>13.5dB</u>

#### 5.5.5 Measurement Results

The minimum margins to the limits are as follows:

Ch No.	Frequency [MHz]	Test Receiver Reading [dB $\mu\text{V}$ ]	Antenna Polarity	Antenna Height [m]	Table Degree [°]	Factor [dB]	Margin [dB]
3	691.20	43.7	Horizontal	1.4	290	-4.7	7.0
9	691.20	43.4	Horizontal	1.2	220	-4.7	7.3
1	691.20	44.4	Horizontal	1.5	270	-4.7	6.3
1,2,3,9	662.40	43.9	Horizontal	3.2	160	-5.6	7.7

Note:

- 1.Emission Level (Margin) = Limit – [Reading + Factor (Antenna + Cable - Amp)]
- 2.The 6 highest emissions relative to the limits are reported.
- 3.The EUT was found to comply to the limits of FCC Part15 Subpart C and RSS-210 with a margin of 6.3dB.
4. No emissions were detected in frequency range 9KHz to 30MHz at the 3 meters distance.
- 5.Test was performed with and without pushing the operation button of EUT, however, emission level was not changed.

#### 5.5.6 Data

As for the chart of the observed RF profiles, refer to Annex D.
