

Response to TCB Findings

1. Please confirm the base has complied with the requirements of 15.31(e) and fresh batteries have been used for the handset testing.

Response: For the base the voltage was varied +/- 15% (102 to 138 Vac) with no impact on output power. And for the handset a fully charged 3.6 V battery pack was used and the power was varied from +15% to battery cutoff, which was at approximately 3.0 V, with no impact on output power.

2. Please specify the detector function used during the radiated emissions testing below 1GHz, including fundamentals.

Response: Detector function used below 1 GHz was PEAK.
