## GENERAL INFORMATION

### Product Description for Equipment Under Test (EUT)

The *VTech Telecommunications Ltd.* product, FCC ID: *EW780-5681-00*, or the “EUT” as referred to in this report is a 5.8 GHz Corded/Cordless Answering System, which measures approximately 190mmL x 50mm W x 35mm H for the handset unit and 2200mmL x 200mm W x 100mm H for the base unit . The EUT is a FHSS device, which operates at the frequency range of 5744.736 – 5825.952MHz, with the maximum conducted output power of 341.19mW for handset and 368.98mW for base.

\* *The test data gathered are from a production sample, S/N: HSPPA002, provided by the manufacturer.*

### Objective

This type approval report is prepared on behalf of *VTech Telecommunications Ltd.* in accordance with Part 2, Subpart J, Part 15, Subparts A, B, C.,

### Related Submittal(s)/Grant(s)

No Related Submittals

### Test Methodology

All measurements contained in this report were conducted with ANSI C63.4-2003& TIA/EIA-603.

### Test Facility

The Open Area Test site used by BACL to collect radiated and conducted emission measurement data is located in the back parking lot of the building at 230 Commercial Street, Sunnyvale, California, USA.

Test site at BACL has been fully described in reports submitted to the Federal Communication Commission (FCC) and Voluntary Control Council for Interference (VCCI). The details of these reports has been found to be in compliance with the requirements of Section 2.948 of the FCC Rules on February 11 and December 10, 1997 and Article 8 of the VCCI regulations on December 25, 1997. The facility also complies with the radiated and AC line conducted test site criteria set forth in ANSI C63.4-2003.

The Federal Communications Commission and Voluntary Control Council for Interference has the reports on file and is listed under FCC file 31040/SIT 1300F2 and VCCI Registration No.: C-1298 and R-1234. The test site has been approved by the FCC and VCCI for public use and is listed in the FCC Public Access Link (PAL) database.

Additionally, BACL is a National Institute of Standards and Technology (NIST) accredited laboratory, under the National Voluntary Laboratory Accredited Program (Lab Code 200167-0). The current scope of accreditations can be found at <http://ts.nist.gov/ts/htdocs/210/214/scopes/2001670.htm>

## SYSTEM TEST CONFIGURATION

### Justification

The EUT was configured for testing according to ANSI C63.4-2003.

The EUT was tested in the normal (native) operating mode to represent *worst-case* results during the final qualification test.

### Special Accessories

As shown in following test block diagram, all interface cables used for compliance testing are shielded.

### Schematics / Block Diagram

Please refer to Appendix A.

### Equipment Modifications

No modifications were made to the EUT.

### Local Support Equipment List and Details

| Manufacturer     | Description    | Model     | Serial Number | FCC ID |
|------------------|----------------|-----------|---------------|--------|
| Teltone          | Line Simulator | TLS-3B-01 | 80071         | N/A    |
| Southern Telecom | Phone          | N/A       | N/A           | N/A    |

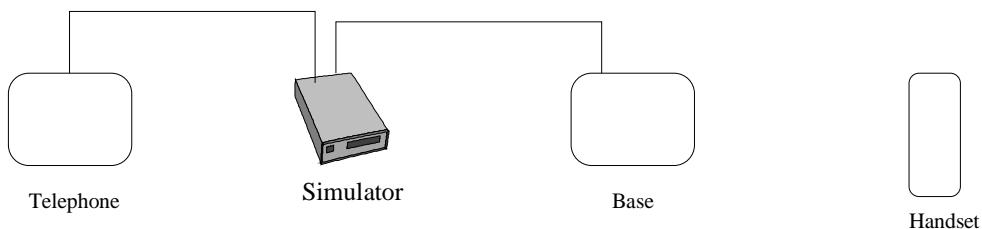

### External I/O Cabling List and Details

| Cable Description | Length (M) | Port/From                    | To    |
|-------------------|------------|------------------------------|-------|
| Phone Line        | 1.0        | Line 1 Port / Line Simulator | Phone |
| Phone Line        | 1.0        | Line 2 Port / Line Simulator | EUT   |

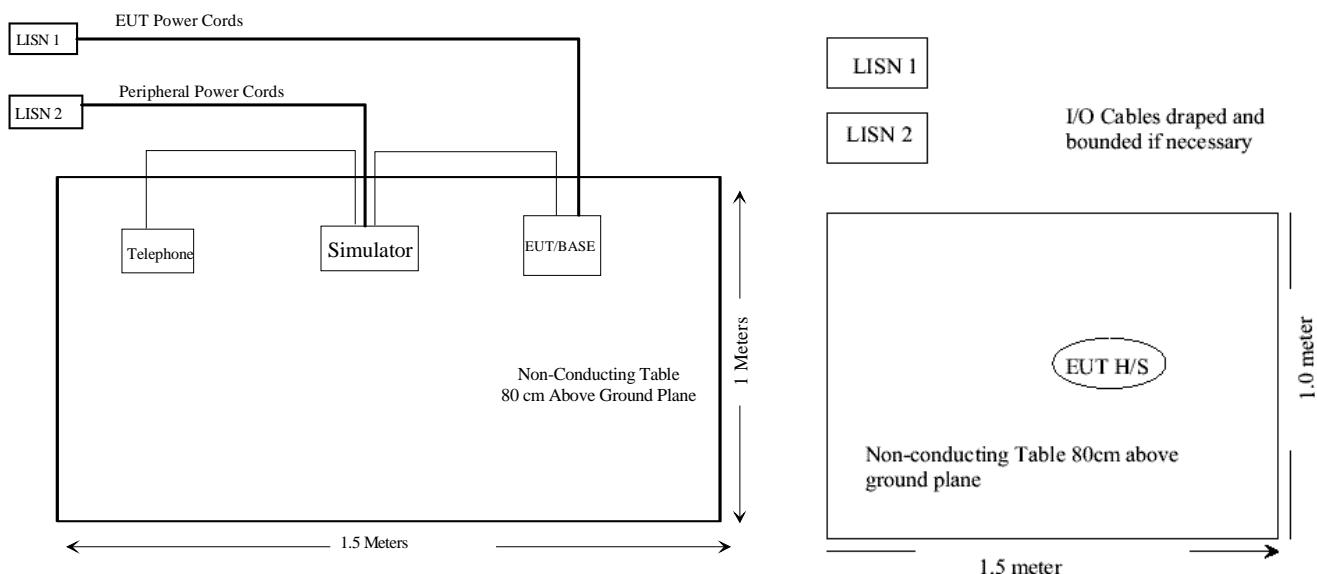

### Power Supply Information

| Manufacturer | Description | Model      | Serial Number | FCC ID |
|--------------|-------------|------------|---------------|--------|
| V tech       | AC Adapter  | U080085D31 | N/A           | N/A    |

## Configuration of Test System

## Test Setup Block Diagram

**SUMMARY OF TEST RESULTS FOR FCC PART 15**

| FCC RULES                   | DESCRIPTION OF TEST  | RESULT     |
|-----------------------------|--|------------|
| §15.203                     | Antenna Requirement  | Compliant  |
| § 15.205                    | Restricted Bands   | Compliant  |
| §15.207 (a)                 | Conducted Emission   | Compliant  |
| §15.209                     | Radiated Emission  | Compliant* |
| §15.247 (a) (1)             | Hopping Channel Separation                                     | Compliant  |
| §15.247 (a) (1)             | Channel Bandwidth  | Compliant  |
| §15.247 (a) (1) (ii)        | Number of Hopping Frequencies Used                             | Compliant  |
| §15.247 (a) (1) (ii)        | Dwell Time of Each Frequency within a 30 Second Period of time | Compliant  |
| §15.247 (b) (1)             | Maximum Peak Output Power                                      | Compliant  |
| § 15.247 (b)(4)<br>§ 2.1093 | RF Safety Requirements   | Compliant  |
| § 15.247 (d)                | 100 kHz Bandwidth of Frequency Band Edge                       | Compliant  |
| § 2.1051                    | Spurious Emission at Antenna Port                              | Compliant  |

\*: Test data are within measurement uncertainty.

## **ANTENNA REQUIREMENT**

---

According to § 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

And according to § 15.247 (1), if transmitting antennas of directional gain greater than 6 dBi are used the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

The gain of antenna used for transmitting is 0 dBi by default, and the antenna connector is designed with permanent attachment and no consideration of replacement. Please see EUT photo for details.

## §15.207(a) - CONDUCTED EMISSION

### Measurement Uncertainty

All measurements involve certain levels of uncertainties, especially in field of EMC. The factors contributing to uncertainties are receiver, cable loss, and LISN.

Based on NIS 81, The Treatment of Uncertainty in EMC Measurements, the best estimate of the uncertainty of any conducted emissions measurement at BACL is  $\pm 2.4$  dB.

### Test Setup

The measurement was performed at shield room, using the same setup per ANSI C63.4-2003 measurement procedure. The specification used was FCC Class B limits.

External I/O cables were draped along the edge of the test table and bundle when necessary.

The EUT was connected with LISN-1.

### Receiver Setup

The receiver was set to investigate the frequency from 150 kHz to 30MHz.

### Test Equipment List and Details

| Manufacturer    | Description       | Model   | Serial Number | Cal. Date  |
|-----------------|-------------------|---------|---------------|------------|
| Rohde & Schwarz | LISN              | ESH2-Z5 | 871884/039    | 2004-08-16 |
| Rohde & Schwarz | EMI Test Receiver | ESCS30  | 100176        | 2004-09-15 |

\* **Statement of Traceability:** BACL Corp. attests that all calibrations have been performed per the NVLAP requirements, traceable to the NIST.

### Test Procedure

During the conducted emission test, the power cord of the host system was connected to the mains outlet of the LISN-1.

Maximizing procedure were performed on the six (6) highest emissions of the EUT.

All data was recorded in the peak detection mode, quasi-peak and average. Quasi-Peak readings are distinguished with an "QP". Average readings are distinguished with an "Ave".

### Environmental Conditions

|                    |           |
|--------------------|-----------|
| Temperature:       | 19° C     |
| Relative Humidity: | 65%       |
| ATM Pressure:      | 1018 mbar |

\*The testing was performed by Snell Leong on 2005-04-14.

**Summary of Test Results**

According to the recorded data in following table, the EUT complied with the FCC Conducted limit for a Class B device, with the *worst* margin reading of:

**-18.1 dB at 13.300 MHz** in the **Neutral** conductor,

## §15.205 & §15.209 - RADIATED EMISSION

### Measurement Uncertainty

All measurements involve certain levels of uncertainties, especially in field of EMC. The factors contributing to uncertainties are spectrum analyzer, cable loss, antenna factor calibration, antenna directivity, antenna factor variation with height, antenna phase center variation, antenna factor frequency interpolation, measurement distance variation, site imperfections, mismatch (average), and system repeatability.

Based on NIS 81, The Treatment of Uncertainty in EMC Measurements, the best estimate of the uncertainty of a radiation emissions measurement at BACL is  $\pm 4.0$  dB.

### Test Setup

The radiated emission tests were performed in the open area 3-meter test site, using the setup in accordance with ANSI C63.4-2003. The specification used was the FCC 15 Subpart C limits.

The spacing between the peripherals was 10 centimeters.

External I/O cables were draped along the edge of the test table and bundle when necessary.

The EUT was connected with 120Vac/60Hz power source.

### Spectrum Analyzer Setup

According to FCC Rules, 47 CFR §15.33 (a) (1), the system was tested to 40GHz.

During the radiated emission test, the spectrum analyzer was set with the following configurations:

| <b><u>Frequency Range</u></b> | <b><u>RBW</u></b> | <b><u>Video B/W</u></b> |
|-------------------------------|-------------------|-------------------------|
| Below 30MHz                   | 10kHz             | 10kHz                   |
| 30 – 1000MHz                  | 100kHz            | 100kHz                  |
| Above 1000MHz                 | 1MHz              | 1MHz                    |

### Test Equipment List and Details

| <b>Manufacturer</b> | <b>Description</b>        | <b>Model</b> | <b>Serial Number</b> | <b>Cal. Date</b> |
|---------------------|---------------------------|--------------|----------------------|------------------|
| Wisewave            | Antenna, Horn, Std        | ARH-2823-02  | 10555-02             | 2004-12-13       |
| HP                  | Amplifier, Pre            | 8447D        | 2944A10198           | 2004-08-20       |

| EMCO                | Antenna, Biconical        | 3110B        | 9603-2315            | 2004-12-14       |
| EMCO                | Antenna, log-<br>Periodic | 3148         | 4-1155               | 2004-12-14       |

\* **Statement of Traceability:** BACL Corp. attests that all calibrations have been performed per the NVLAP requirements, traceable to the NIST.

## Environmental Conditions

|                    |           |
|--------------------|-----------|
| Temperature:       | 19° C     |
| Relative Humidity: | 65%       |
| ATM Pressure:      | 1018 mbar |

\*The testing was performed by Snell Leong on 2005-04-14.

## Test Procedure

Maximizing procedure was performed on the six (6) highest emissions to ensure EUT compliance is with all installation combinations.

All data was recorded in the peak detection mode. Quasi-peak readings was performed only when an emission was found to be marginal (within -4 dB of specification limits), and are distinguished with a "Qp" in the data table.

## Corrected Amplitude & Margin Calculation

The Corrected Amplitude is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain from the Amplitude reading. The basic equation is as follows:

$$\text{Corr. Ampl.} = \text{Indicated Reading} + \text{Antenna Factor} + \text{Cable Factor} - \text{Amplifier Gain}$$

The “Margin” column of the following data tables indicates the degree of compliance with the applicable limit. For example, a margin of -7dB means the emission is 7dB below the maximum limit for Class B. The equation for margin calculation is as follows:

$$\text{Margin} = \text{Corr. Ampl.} - \text{Class B Limit}$$

## Summary of Test Results

According to the recorded data in following table, the EUT test data are within the measurement uncertainty of  $\pm 4.0\text{dB}$ , and had the worst margin of:

### Base:

- 0.5 dB at 11489.472 MHz** in the **Vertical** polarization, Low Channel, 3 meters
- 0.4 dB at 11570.668 MHz** in the **Vertical** polarization, Middle Channel, 3 meters
- 1.7 dB at 11651.9040 MHz** in the **Vertical** polarization, High Channel, 3 meters
- 1.5 dB at 82.940 MHz** in the **Vertical** polarization, Unintentional Emission, 3 meters

### Handset:

- 10.4 dB at 11489.472 MHz** in the **Vertical** polarization, Low Channel, 3 meters
- 8.6 dB at 11570.668 MHz** in the **Vertical** polarization, Middle Channel, 3 meters
- 9.1 dB at 11651.9040 MHz** in the **Vertical** polarization, High Channel, 3 meters
- 17.7 dB at 33.46 MHz** in the **Vertical** polarization, Unintentional Emission, 3 meters

*Note: Test was conducted in non-hopping continuous transmitting mode.*

## §15.247 (a) (1) - HOPPING CHANNEL SEPARATION

### Standard Applicable

According to §15.247(a)(1), frequency hopping system shall have, hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudorandomly ordered list of hopping frequencies.

### Measurement Procedure

1. Check the calibration of the measuring instrument (SA) using either an internal calibrator or a known signal from an external generator.
2. Position the EUT on a bench without connection to measurement instrument Turn on the EUT and connect it to measurement instrument. Then set it to any one convenient frequency within its operating range.
3. By using the Max-Hold function record the separation of two adjacent channels.
4. Measure the frequency difference of these two adjacent channels by SA MARK function, and then plot the result on SA screen.
5. Repeat above procedures until all frequencies measured were complete.

### Test Equipment

| Manufacturer | Description       | Model No. | Serial No. | Calibration Date |
|--------------|-------------------|-----------|------------|------------------|
| HP           | Spectrum Analyzer | 8565EC    | 3946A00131 | 2004-08-06       |

\* **Statement of Traceability:** **BACL Corp.** attests that all calibrations have been performed per the NVLAP requirements, traceable to the NIST.

### Environmental Conditions

|                    |           |

## §15.247 (a) (1) - CHANNEL BANDWIDTH

### Standard Applicable

According to §15.247(a)(1), the maximum 20 dB bandwidth of the hopping channel shall be 1 MHz.

### Measurement Procedure

1. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
2. Position the EUT without connection to measurement instrument. Turn on the EUT and connect it to measurement instrument. Then set it to any one convenient frequency within its operating range. Set a reference level on the measuring instrument equal to the highest peak value.
3. Measure the frequency difference of two frequencies that were attenuated 20 dB from the reference level. Record the frequency difference as the emission bandwidth.
4. Repeat above procedures until all frequencies measured were complete.

### Test Equipment

## **§15.247 (a) (1) (ii) - NUMBER OF HOPPING FREQUENCY USED**

### **Standard Applicable**

According to §15.247(a)(1)(ii), frequency hopping systems operating in the 5725-5850MHz band shall use at least 75 hopping frequencies.

### **Measurement Procedure**

1. Check the calibration of the measuring instrument (SA) using either an internal calibrator or a known signal from an external generator.
2. Position the EUT on the bench without connection to measurement instrument. Turn on the EUT and connect its antenna terminal to measurement instrument via a low loss cable. Then set it to any one measured frequency within its operating range, and make sure the instrument is operated in its linear range.
3. Set the SA on Max-Hold Mode, and then keep the EUT in hopping mode. Record all the signals from each channel until each one has been recorded.
4. Set the SA on View mode and then plot the result on SA screen.
5. Repeat above procedures until all frequencies measured were complete.

## §15.247 9 (a) (1) (ii) - DWELL TIME

### Standard Applicable

According to §15.247 (a)(1)(ii), the average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 30 seconds.

### Measurement Procedure

1. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
2. Position the EUT was set without connection to measurement instrument. Turn on the EUT and connect its antenna terminal to measurement instrument via a low loss cable. Then set it to any one measured frequency within its operating range, and make sure the instrument is operated in its linear range.
3. Adjust the center frequency of SA on any frequency be measured and set SA to zero span mode. And then, set RBW and VBW of spectrum analyzer to proper value.
4. Measure the time duration of one transmission on the measured frequency. And then plot the result with time difference of this time duration.
5. Repeat above procedures until all frequencies measured were complete.

### Test Equipment

## §15.247 (e)(i) - RF EXPOSURE

According to §15.247(e)(i) and §1.1307(b)(1), systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

According to §1.1310 and §2.1093 RF exposure is calculated.

### Limits for Maximum Permissive Exposure (MPE)

| Frequency Range (MHz)                               | Electric Field Strength (V/m) | Magnetic Field Strength (A/m) | Power Density (mW/cm <sup>2</sup> ) | Averaging Time (minute) |
|---|-------------------------------|-------------------------------|-------------------------------------|-------------------------|
| Limits for General Population/Uncontrolled Exposure |                               |                               |                                     |                         |
| 0.3-1.34  | 614                           | 1.63                          | *(100)                              | 30                      |
| 1.34-30   | 824/f                         | 2.19/f                        | *(180/f <sup>2</sup> )              | 30                      |
| 30-300  | 27.5                          | 0.073                         | 0.2                                 | 30                      |
| 300-1500  | /                             | /                             | f/1500                              | 30                      |
| 1500-15000  | /                             | /                             | 1.0                                 | 30                      |

f = frequency in MHz

\* = Plane-wave equivalent power density

### MPE Prediction

Predication of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = PG/4\pi R^2$$

Where: S = power density

P = power input to antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

Base:

Maximum peak output power at antenna input terminal: 25.67 (dBm)

Maximum peak output power at antenna input terminal: 368.98 (mW)

Prediction distance: 20 (cm)

Predication frequency: 5800 (MHz)

Antenna Gain (typical): 0 (dBi)

Maximum antenna gain: 1(numeric)

Power density at predication frequency at 20 cm: 0.073(mW/cm<sup>2</sup>)

MPE limit for uncontrolled exposure at prediction frequency: 1.0 (mW/cm<sup>2</sup>)

### Test Result

The predicted power density level at 20 cm is 0.073 mW/cm<sup>2</sup>. This is below the uncontrolled exposure limit of 1mW/cm<sup>2</sup> at 5800 MHz. The base of the EUT is used at least 20cm away from user's body. It is determined as mobile equipment.

## §15.247 (d) - 100 KHZ BANDWIDTH OF BAND EDGES

### Standard Applicable

According to §15.247(d), in any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. Attenuation below the general limits specified in §15.209(a) is not required.

### Measurement Procedure

1. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
2. Position the EUT without connection to measurement instrument. Turn on the EUT and connect its antenna terminal to measurement instrument via a low loss cable. Then set it to any one measured frequency within its operating range, and make sure the instrument is operated in its linear range.
3. Set both RBW and VBW of spectrum analyzer to 100 kHz with a convenient frequency span including 100kHz bandwidth from band edge.
4. Measure the highest amplitude appearing on spectral display and set it as a reference level. Plot the graph with marking the highest point and edge frequency.
5. Repeat above procedures until all measured frequencies were complete.

### Test Equipment

| Manufacturer | Description       | Model No. | Serial No. | Calibration Date |
|--------------|-------------------|-----------|------------|------------------|
| HP           | Spectrum Analyzer | 8565EC    | 3946A00131 | 2004-08-06       |

\* **Statement of Traceability:** BACL Corp. attests that all calibrations have been performed per the NVLAP requirements, traceable to the NIST.

### Environmental Conditions

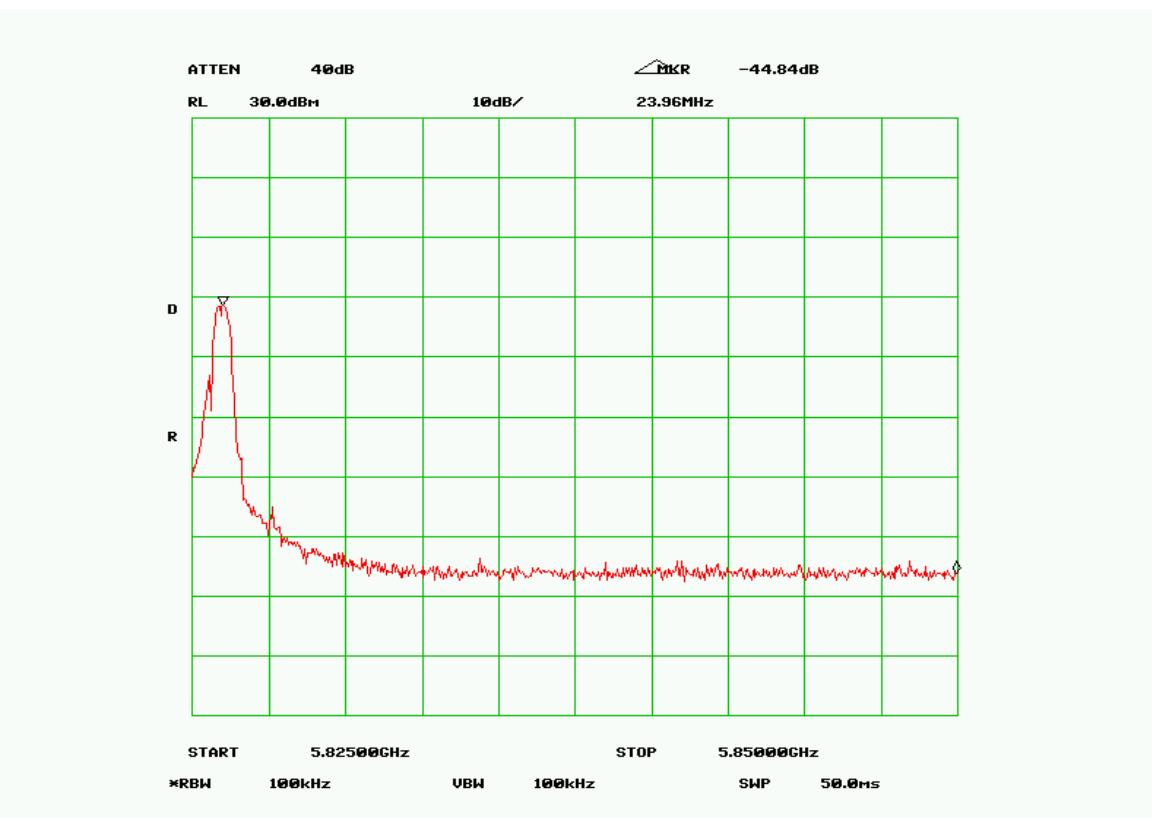

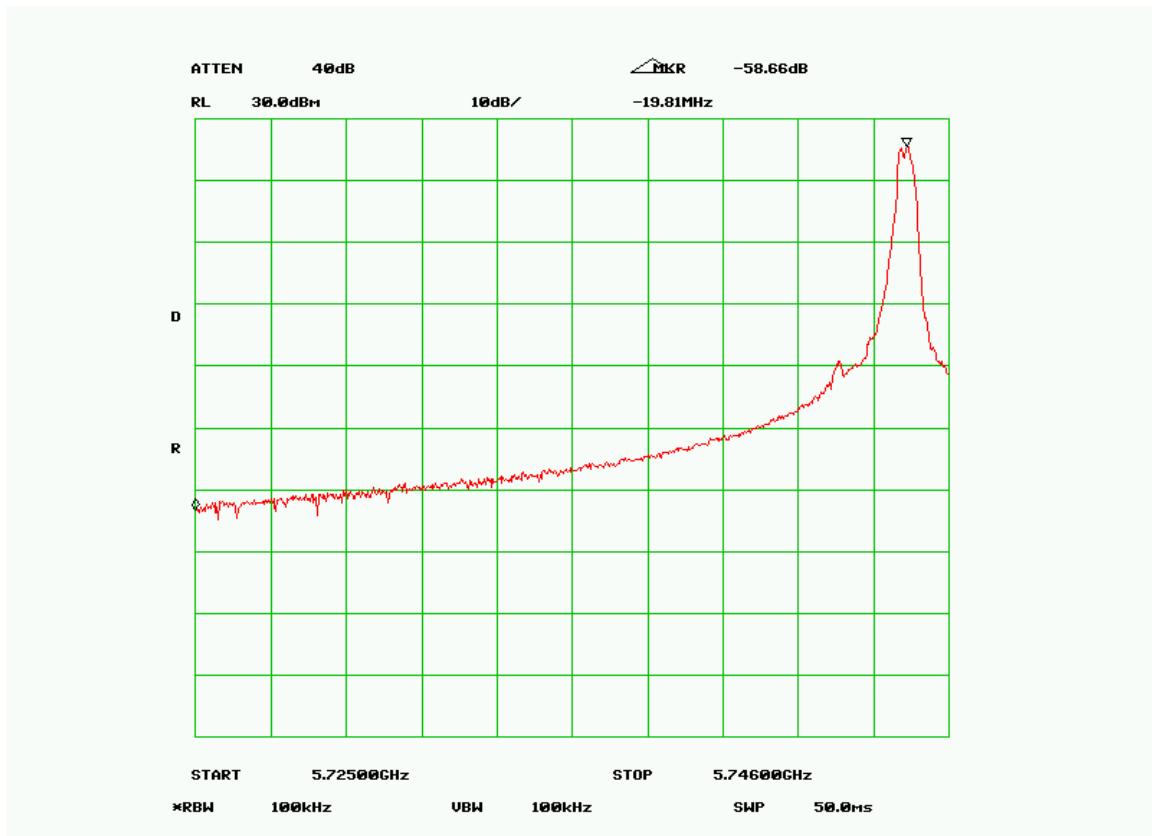

|                    |           |
|--------------------|-----------|
| Temperature:       | 19° C     |
| Relative Humidity: | 65%       |
| ATM Pressure:      | 1018 mbar |

\*The testing was performed by Snell Leong on 2005-04-14.

## § 2.1051 - SPURIOUS EMISSION AT ANTENNA PORT

### Standard Applicable

According to §15.209 (f) and §15.33(a), in some cases the emissions from an intentional radiator must be measured to beyond the tenth harmonic of the highest fundamental frequency designed to be emitted by the intentional radiator because of the incorporation of a digital device. If measurements above the tenth harmonic are so required, the radiated emissions above the tenth harmonic shall comply with the general radiated emission limits applicable to the incorporated digital device, as shown in §15.109 and as based on the frequency of the emission being measured, or, except for emissions contained in the restricted frequency bands shown in §15.205, the limit on spurious emissions specified for the intentional radiator, whichever is the higher limit.

### Measurement Procedure

1. Check the calibration of the measuring instrument (SA) using either an internal calibrator or a known signal from an external generator.
2. Position the EUT on a bench without connection to measurement instrument. Turn on the EUT and connect its antenna terminal to measurement instrument via a low loss cable. Then set it to any one measured frequency within its operating range, and make sure the instrument is operated in its linear range.
3. Set the SA on Max-Hold Mode, and then keep the EUT in transmitting mode. Record all the signals from each channel until each one has been recorded.
4. Set the SA on View mode and then plot the result on SA screen.
5. Repeat above procedures until all frequencies measured were complete.
