NOTICE OF PROPRIETARY INFORMATION

Information contained herein is proprietary and is property of **ITRON, Inc.** where furnished with a proposal, the recipient shall use it solely to evaluate the proposal. Where furnished to a customer it shall be used solely for the purposes of inspection, installation or maintenance. Where furnished to a supplier, it shall be used solely in the performance of work contracted for this company. The information shall not be used or disclosed by the recipient for any other purpose, whatsoever.

Test Data Summary
 FCC Part 15.249 / IC RSS-210 Sec. 6.2.2(m2);
 Field strength of Low Power Transmitters,
 100TGGRD; 908 MHz
 FCC ID: EWQ100TGGRD
 IC ID: 864D-100TGGRD
 IC Device Models: GGRD
 OATS Registration Number: FCC 90716, IC 864D-1

CONDITIONS DURING TESTING

No Modifications to the EUT were necessary during the testing.

FCC 15.31(m) – IC _n/a_; Number of Channel

This device operates and was tested on one channel.

ANSI C63.4 - Temperature and Humidity During Testing

The temperature during testing was within +10° C and +40° C.

The Relative humidity was between 10% and 90%.

RSS-Gen 4.3: Tests shall be performed at ambient temperature

EQUIPMENT UNDER TEST (EUT) DESCRIPTION

Itron declares that the EUT tested was representative of a production unit.

EQUIPMENT UNDER TEST

EUT Module

Manufacturer:	Itron, Inc.
Itron Model:	100T-GGRD- Gas Gate Remote Disconnect
Itron p/n:	GRD-5013-001
Serial Number(s)	9830,9793,9853,56083 and Listed Below
Power source	Fresh Batteries were used

Plot Information

In the zero span measurements, the line in the display is the trigger level.

Peripheral Devices

None

15.31(e)

Variation of Supply Voltage

Vary the supply voltage from 85% to 115% of the nominal voltage. If the power level of the fundamental signal varies with supply voltage, record the voltage level at which the fundamental signal is at its highest and use that voltage level for all further testing.

DEVICE IS BATTERY OPERATED NOT CONNECTED TO THE POWER LINE. BATTERY IS NOT RECHARGABLE. THEREFORE THIS TEST IS N/A.

15.207 / RSS-GEN 7.2.2

Power line Conducted Emissions

Measure the AC power line conducted emissions from 150kHz to 30 MHz using a 50mH/50ohm line impedance stabilization network (LISN) according to the procedure specified in ANSI C63.4. Verify that no emissions exceed the following limits:

Frequency (MHz)	Quasi-Peak (dBuV)	Average (dBuV)
0.15-0.5	66 to 56	56 to 46
0.5-5	56	46
5-30	60	50

Decreases with the logarithm of frequency

DEVICE IS BATTERY OPERATED NOT CONNECTED TO THE POWER LINE. BATTERY IS NOT RECHARGABLE. THEREFORE THIS TEST IS N/A.

15.209 / RSS-210 sec. 6.2(m2)(3)

Out of band non-harmonic emissions

Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table

Frequency (MHz)	Field Strength (microvolts/meter)	in dBuV/m	Measurement Distance (meters)*
0.009-0.490	2440F (kHz)		300
0.490-1.705	2400F (kHz)		30
1.705-30.0	30	29.5	30
30-88	100	40	3
88-216	150	43.5	3
216-960	200	46	3
Above 960	500	54	3

FS (dBuV) = 20 * log (FS(uV/m))

* Adjust when measuring at different distances than specified; 40dB/decade <30MHz and 20dB/decade >=30MHz. (at 30MHz depends on the antenna used)

note: 15.249(e) As shown in §15.35(b), for frequencies above 1000 MHz, the field strength limits in paragraphs (a) and (b) of this section are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

Measure the field strength of all spurious emissions that are not harmonics according to the procedure in Appendix A.

Frequency range investigated was 9 kHz to 9.08GHz.

For emissions measurements below 30MHz, rotate the loop antenna about its horizontal and vertical positions to maximize emissions.

DUT is endpoint 9853, battery was new.

Equipment Used	Serial Number	Cal Date	Due

No Emissions found

15.35(b) / RSS-210 sec. 6.5
Pulsed Operation

Calculate the maximum duty cycle of the transmitter that will occur in any 100ms. Perform the following calculation:

$$\begin{aligned} \text{Duty Cycle}_{dB} &= |20 * \log(\text{Duty Cycle} / 100\text{ms})| \\ \text{Duty Cycle}_{dB} &= 20 * \log(0.5316) \\ \text{Duty Cycle}_{dB} &= -5.49\text{db} \end{aligned}$$

15.249(a)/RSS-210 sec. 6.2(m2)(1)

Transmitter Fundamental and Harmonics

(a) Except as provided in paragraph (b) of this section, the field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following: (table below)

(c) Field strength limits are specified at a distance of 3 meters.

(e) As shown in §15.35(b), for frequencies above 1000 MHz, the field strength limits in paragraphs (a) and (b) of this section are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

Measure the field strength of the transmitter fundamental and harmonic emissions at three meters according to the procedure in Appendix A. Record emissions levels with the transmitter near its lowest, middle, and highest frequencies. The maximum field strength of emissions may not exceed:

Frequency range investigated was 908 MHz to 9.08GHz.

Fundamental (mV/m)	in (dBuV/m)	Harmonics (mV/m)	in (dBuV/m)
50,000	94	500	54

$$FS \text{ (dBuV/m)} = 20 * \log (FS \text{ (uV/m)})$$

DUT is endpoint 9830, battery was new

Freq. MHz	Peak Level measured dBm(3)	Amplifier Gain dB	Ant. Factor dB	Cable and Filter Loss dB(5)	peak Level dBuV/m (1)	average Level dBuV/m (4)
908	-39.45	0.00	22.03	2.78	92.36	
3632	-55.89	32.91	31.72	6.35	56.27	50.78
7264	-63.39	33.57	36.15	9.06	55.25	49.76
5448	-60.77	33.94	34.13	7.84	54.26	48.77
2724	-57.43	33.22	28.76	5.51	50.62	45.13
1816	-56.31	33.32	27.24	4.71	49.32	43.83

(1)Level (dbuV/m)=Level (dbm) +107* – Amplifier Gain (db) +Ant. Factor (db/m) + Cable Loss (db)
note: level dbm +107 = level dbuV @ 50 ohms

(3)RBW & VBW =100KHz below 1GHz and 1MHz above 1GHz.

(4) Average level measurement used Quasi peak below 1 GHz and, Above 1 Ghz duty cycle correction of -5.49 db, as calculated earlier in the report, was applied .

(5)Cable loss includes 1.3 Ghz high pass filter insertion loss for frequencies above 1.3 Ghz. Frequencies below 1.3Ghz did not use the Filter.

FCC Part 15.249(d)

Band Edge, radiated

(d) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209 (200uV/m(46dbuV/m) at 3 meters), whichever is the lesser attenuation.

Use the following spectrum analyzer settings:

- Span = wide enough to capture the peak level of the emission operating on the channel closest to the band edge, as well as any modulation products which fall outside of the authorized band of operation
- RBW \geq 1% of the span
- VBW \geq RBW
- Sweep = auto
- Detector function = peak
- Trace = max hold

Allow the trace to stabilize. Set the marker on the emission at the band edge, or on the highest modulation product outside of the band, if this level is greater than that at the band edge. Enable the marker-delta function, and then use the marker-to-peak function to move the marker to the peak of the in-band emission. The marker-delta value now displayed must comply with the limit specified in this Section. Submit this plot.

Now, using the same instrument settings, enable the hopping function of the EUT. Allow the trace to stabilize. Follow the same procedure listed above to determine if any spurious emissions caused by the hopping function also comply with the specified limit.

Equipment Used	Serial Number	Cal Date	Due
Agilent E7405A Spectrum Analyzer	MY45113415	7/9/2012	7/9/2013
Microcoax 40 foot cable	H1G315G1	4/15/2011	4/15/2013
AH systems preamplifier model number PAM 0126	146	2/6/2012	2/6/2014
EMCO 3148 Log periodic (200MHz to 1GHz)	9203-3358	7/20/2011	7/20/2013

Band Edge	Test Setup	Level	Pass/Fail
902 MHz	Radiated	35.24 dbuV/m (1)(2)	Pass
928 MHz	Radiated	29.4 dbuV/m (1)(2)	Pass
908 MHz	Radiated	92.36 dbuV/m	Pass

(1) per the rules, radiated is allowed to show compliance.

(2) reading was obtained using a quasi peak detector.

Radiated setup: Endpoint 9853, with a new battery, was placed at 3 meters and the field strength was maximized and measured with the log periodic antenna, connected to the E7405A analyzer through an amplifier and a 40 foot cable. The Antenna correction factor, Cable loss, and amplifier gain were loaded into the analyzer, so the analyzer displayed the corrected level. Endpoint 9853 was at the maximized field strength position at 0 degrees the antenna was positioned to Horizontal 148 cm. The band edge at 902 MHz and 928 MHz was measured using a quasi peak detector.

The device was set to transmit at 908 MHz at the maximum field strength position of 0 degrees, with the antenna horizontal 148 cm. above the ground plane. The band edge signal measured at 902 Mhz was 35.24 dbuV/m

RSS-GEN 4.6.1

99% Bandwidth, conducted

The transmitter shall be operated at its maximum carrier power measured under normal test conditions. The span of the analyzer shall be set to capture all products of the modulation process, including the emission skirts. The resolution bandwidth shall be set to as close to 1% of the selected span as is possible without being below 1%. The video bandwidth shall be set to 3 times the resolution bandwidth. Video averaging is not permitted. Where practical, a sampling detector shall be used since a peak or, peak hold, may produce a wider bandwidth than actual. The trace data points are recovered and are directly summed in linear terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5% of the total is reached and that frequency recorded. The process is repeated for the highest frequency data points. This frequency is recorded. The span between the two recorded frequencies is the occupied bandwidth.

Capture a plot of the 99% bandwidth of a single transmission.

Equipment Used	Serial Number	Cal Date	Due
HP8593E	3543A02032	11/14/12	11/14/13
Date	Tested by		
1/11/2013	Mark Kvamme		

Conducted setup:

Board 9793, with a new battery, was connected to the Hewlett Packard 8593E spectrum analyzer.
99% BW = 43.7 kHz + 96.3 kHz = 140.0 kHz

Appendix A

Field Strength Measurement Procedure

This test measures the field strength of radiated emissions using a spectrum analyzer and a receiving antenna in accordance with ANSI C63.4-2003. During the test, the EUT is to be placed on a non-conducting support at 80 cm above the horizontal ground plane of the OATS. The horizontal distance between the antenna and the EUT is to be exactly 3 meters. The bandwidths used shall be per ANSI C63.4-2003; 200 Hz from 9 kHz to 150 kHz, 9 kHz from 150 kHz to 30 MHz, 100 kHz from 30 MHz to 1000 MHz, and 1 MHz from 1 GHz to 40 GHz, with the detector set to peak hold or quasi peak .

- 1) The antenna correction factor, preamplifier gain (if the preamplifier is installed), and cable loss are stored in tables in the EMC analyzer and the level at the analyzer is the corrected level in dbuV/m.
- 2) Monitor the frequency range of interest at a fixed antenna height and EUT azimuth.
- 3) If appropriate, manipulate the system cables to produce the highest amplitude signal relative to the limit. Note the amplitude and frequency of the suspect signal.
- 4) Rotate the EUT 360° to maximize the suspected highest amplitude signal. If the signal or another at a different frequency is observed to exceed the previously noted highest amplitude signal by 1 dB or more, go back to the azimuth and repeat step 3). Otherwise, orient the EUT azimuth to repeat the highest amplitude observation and proceed.
- 5) Move the antenna over its fully allowed range of travel to maximize the suspected highest amplitude signal. If the signal or another at a different frequency is observed to exceed the previously noted highest amplitude signal by 1 dB or more, return to step 3) with the antenna fixed at this height. Otherwise, move the antenna to the height that repeats the highest amplitude observation and proceed.
- 6) Change the polarity of the antenna and repeat step 3), step 4), and step 5). Compare the resulting suspected highest amplitude signal with that found for the other polarity. Select and note the higher of the two signals.
- 7) The final maximized level displayed on the EMC analyzer is the field strength.
