

## Evaluation of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where:

S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

| Maximum peak output powerConducted | 6.95    | dBm       |
|------------------------------------|---------|-----------|
|                                    | 0.005   | (W)       |
| Antenna gain(typical):             | 0.00    | (dBi)     |
| Maximum antenna gain:              | 1.00    | (numeric) |
| Evaluation distance:               | 20.00   | (cm)      |
| Evaluation frequency:              | 914.196 | (MHz)     |
| Limit from table below:            | 0.609   | (mW/cm^2) |
|                                    |         |           |

Power density at Evaluation frequency: 0.00099 (mW/cm^2)

## (B) Limits for General Population/Uncontrolled Exposure

f = frequency in MHz

\*Plane-wave equivalent power density

NOTE 1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.

NOTE 2: General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or cannot exercise control over their exposure.
