Exposure limit according to §15.247(i)

The device is classified as mobile.

Limit for power density for general population/uncontrolled exposure is $f/1500$ mW/cm^2 for 300 – 1500 MHz frequency range:

$P = 912.75/1500 = 0.61$ mW/cm^2

The power density **P (mW/cm^2) $= P_T / 4\pi r^2$**

P_T is the transmitted power, which is equal to the peak transmitter output power 13.6 dBm plus maximum antenna gain (-1) dBi, the maximum equivalent isotropically radiated power EIRP is

$$P_T = 13.6 \text{ dBm} + (-1) \text{ dBi} = 12.6 \text{ dBm} = 18.2 \text{ mW}.$$

The power density at 20 cm (minimum safe distance, required for mobile devices), calculated as follows:

$$18.2 \text{ mW} / 4\pi (20 \text{ cm})^2 = 0.004 \text{ mW/cm}^2 << 0.61 \text{ mW/cm}^2$$

General public cannot be exposed to dangerous RF level.
