

Exposure limit according to §15.247(i)

The magnet contact is classified as a mobile device.

The FCC limit for power density for general population/uncontrolled exposure is $f/1500$ mW/cm² for 300 – 1500 MHz frequency range:

$$P = 912.75/1500 = 0.61 \text{ mW/cm}^2$$

The power density P (mW/cm²) = $P_T / 4\pi r^2$

P_T is the transmitted power, which is equal to the peak transmitter output power 11.9 dBm plus maximum antenna gain 0 dBi, the maximum equivalent isotropically radiated power EIRP is

$$P_T = 11.9 \text{ dBm} + 0 \text{ dBi} = 11.9 \text{ dBm} = 15.49 \text{ mW}.$$

11.9 dBm is the EUT maximum output power with the tune up tolerance,
0 dBi – antenna gain.

The power density at 20 cm (minimum safe distance, required for mobile devices), calculated as follows:

$$\text{Compliance with FCC limit: } 15.49 \text{ mW} / 4\pi (20 \text{ cm})^2 = 0.003 \text{ mW/cm}^2 \ll 0.61 \text{ mW/cm}^2$$

General public cannot be exposed to dangerous RF level.
