Attn: Application Examiner, Reviewing Engineer

Re: Tune-up Procedure

During the manufacture and test process each unit has its output power calibrated across the frequency band at each supported power level. The control values derived are stored in non-volatile memory within the unit for use once deployed. No method exists that allows user access to these parameters.

As part of the installation the frequency must be calibrated (to counter any shift in the OCXO frequency caused during transportation by vibration/shocks etc). Two methods of adjusting the frequency are covered in the User's Manual (Exhibit 8).

Sincerely,

A handwritten signature in blue ink that reads "Mark F. Miska".
