### 5.3 Requirements

Within restricted bands and receive mode:

Reference: CFR 47 §15.209, §15.109, RSS-Gen section 8.9

Field strength of emissions must comply with limits shown in table below

Frequency range [MHz]	Field strength at 3 m (dB $\mu$ V/m)	Field strength at 10 m (dB $\mu$ V/m)	Detector (dB $\mu$ V/m)
30 – 88	40.0	29.5	Quasi Peak
88 – 216	43.5	33.0	Quasi Peak
216 – 960	46.0	35.5	Quasi Peak
960 – 1000	54.0	43.5	Quasi Peak
Above 1000	54.0 / 74.0	43.5 / 63.5	Average / Peak

The values for 10 m measuring distance are calculated by subtracting 10.5 dB from the 3 m limit. (i.e. an extrapolation factor of 20 dB/decade according to CFR 47 §15.31(f)(1))

Outside the restricted bands:

Reference: CFR 47 §15.407 (b), KDB 789033 D02 General UNII Test Procedures New Rulesv01 RSS-247 6.2.2.2, 6.2.3.2, 6.2.4.2

For transmitters operating in the 5.15-5.25 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.

For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.

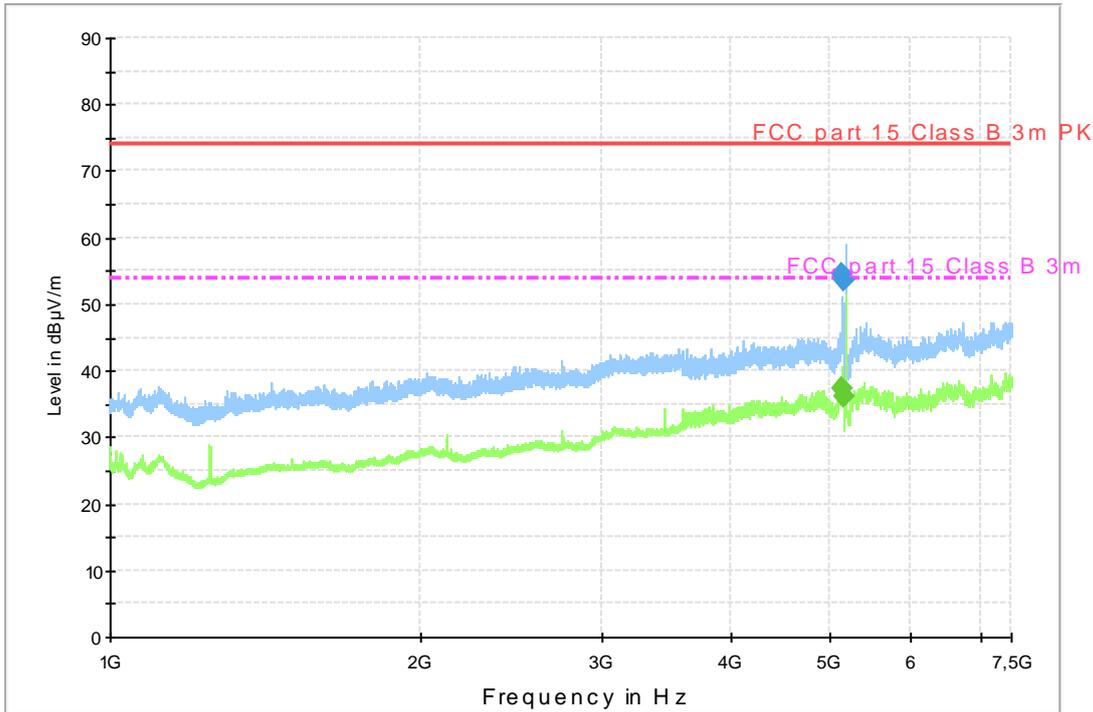

For transmitters operating in the 5.47-5.725 GHz band: All emissions outside of the 5.47-5.725 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.

For transmitters operating in the 5.725-5.85 GHz band: All emissions within the frequency range from the band edge to 10 MHz above or below the band edge shall not exceed an e.i.r.p. of -17 dBm/MHz; for frequencies 10 MHz or greater above or below the band edge, emissions shall not exceed an e.i.r.p. of -27 dBm/MHz.

If the device complies with 15.209 peak and average limits, then peak e.i.r.p level attenuation below -27 dBm/MHz is not required.

### 7.1 Test set-up and test procedure.

The test method is in accordance with KDB 789033 D02 General UNII Test Procedures New Rulesv01r02 section E.

The EUT was connected to spectrum analyser via an rf-cable, a 10 dB attenuator and a coaxial switch.

### 7.2 Test conditions

The spectrum analyser's band power measurement function was used to integrate the power over the whole transmitter band. The analyser marker was used to find the highest PSD value.

### 7.3 Requirements

Reference: CFR 47§15.407(a)

For mobile and portable client devices in the 5.15-5.25 GHz band, the maximum conducted output power over the frequency band of operation shall not exceed 250 mW provided the maximum antenna gain does not exceed 6 dBi. In addition, the maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

For the 5.25-5.35 GHz and 5.47-5.725 GHz bands, the maximum conducted output power over the frequency bands of operation shall not exceed the lesser of 250 mW or 11 dBm + 10 log B, where B is the 26 dB emission bandwidth in megahertz. In addition, the maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

For the band 5.725-5.85 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W. In addition, the maximum power spectral density shall not exceed 30 dBm in any 500-kHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

### 9.1 Requirement

Reference: FCC §15.407(g)

Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user manual.

### 9.2 Test set-up

EUT antenna port was connected to spectrum analyser via rf-cable and 10 dB attenuator placed inside the temperature chamber

### 9.3 Test data

26 dBc bandwidth and the center frequency were tested in each temperature on channel 100. The EUT is for indoor use only and will not be operated in sub 0 °C temperatures.

Center frequencies in extreme temperatures

Temperature [°C]	Center freq [GHz]	Center freq [GHz]	Center freq [GHz]	Center freq [GHz]	Largest Error [kHz]
	0 min	2 min	5 min	10 min

0	5.5000000	5.4998745	5.4998845	5.4998845	126

Conclusion is that the EUT stays within operation band under all conditions.

### 10.1 Requirement

Reference: FCC §15.407(h)(2) RSS 247 6.3

The EUT is a client device without radar detection capability and must comply with channel move time and non-occupancy period requirements.

**Channel Move Time.** After a radar's presence is detected, all transmissions shall cease on the operating channel within 10 seconds. Transmissions during this period shall consist of normal traffic for a maximum of 200 ms after detection of the radar signal. In addition, intermittent management and control signals can be sent during the remaining time to facilitate vacating the operating channel.

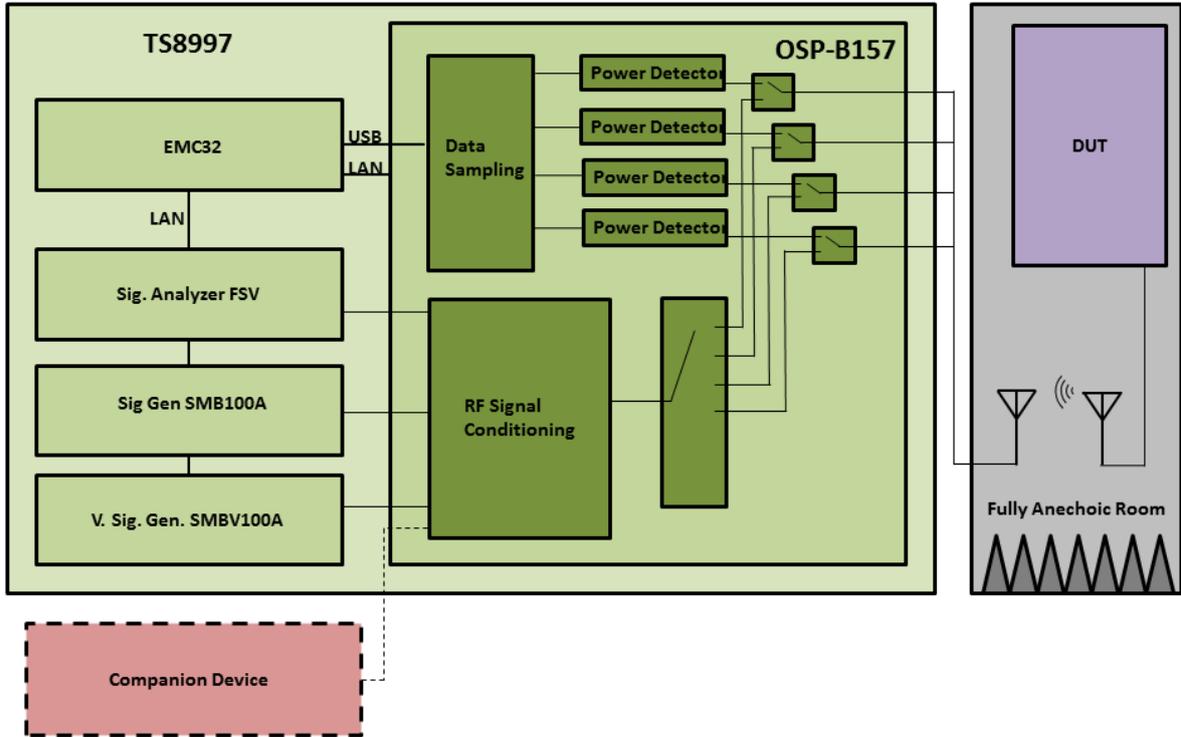

**Non-occupancy Period.** A channel that has been flagged as containing a radar system, either by a channel availability check or in-service monitoring, is subject to a non-occupancy period of at least 30 minutes. The non-occupancy period starts at the time when the radar system is detected.

**10.2 Test set-up**

40 MHz BW was used for testing

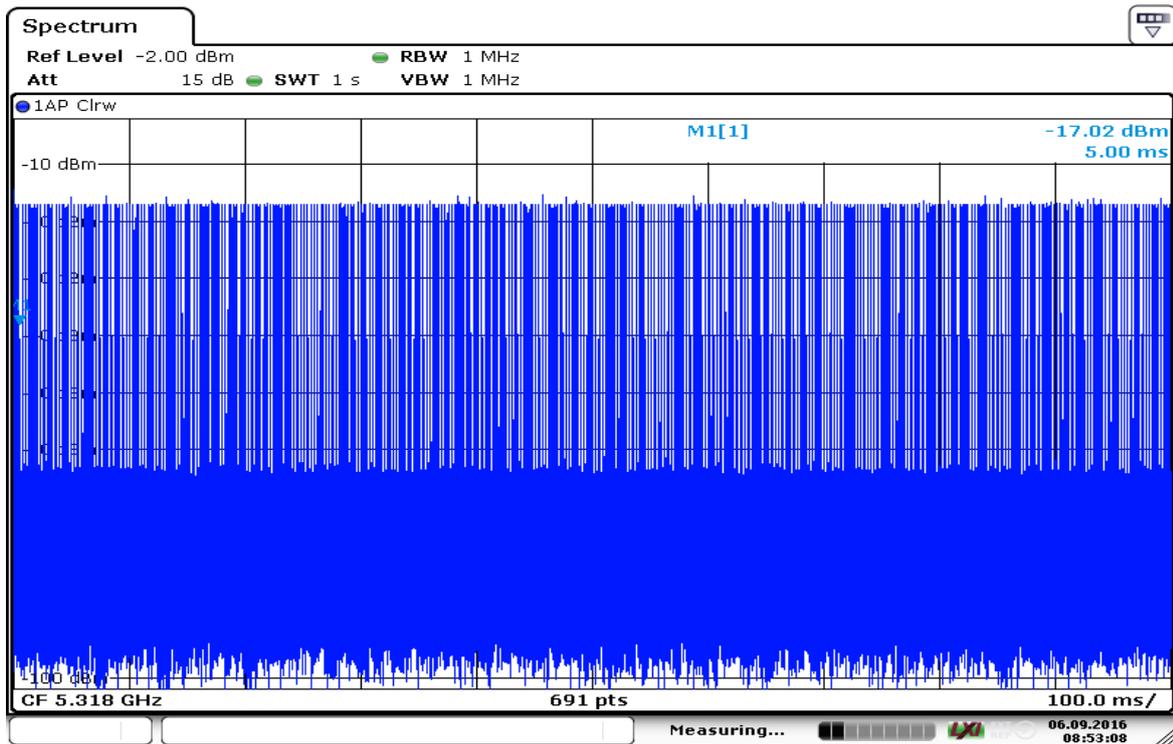

The test method is according to KDB 905462 D02 and D03.

The EUT was connected to a master device and pinged continuously to simulate data transfer.

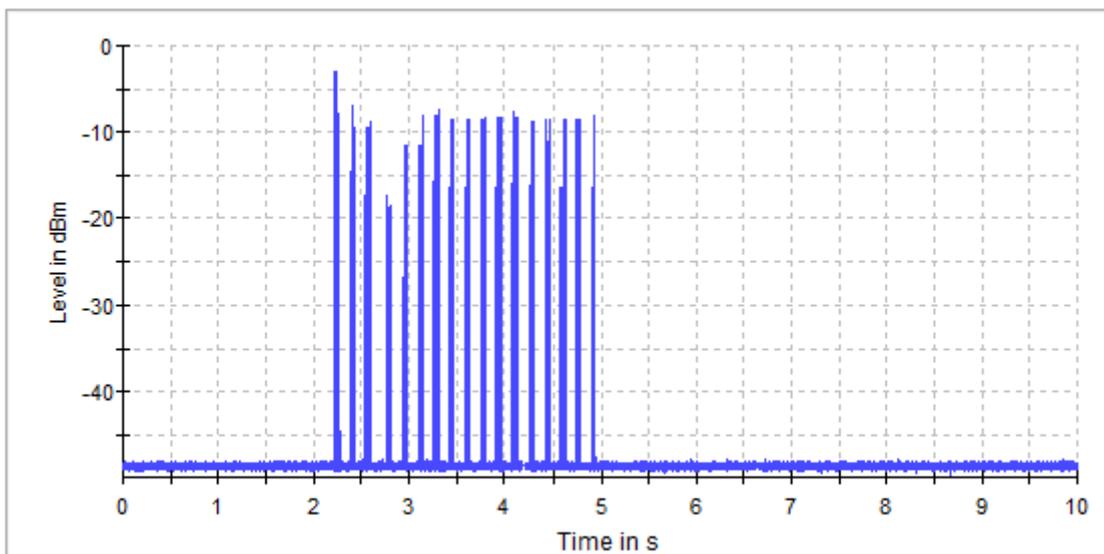

Block diagram of the test system

**Test data**

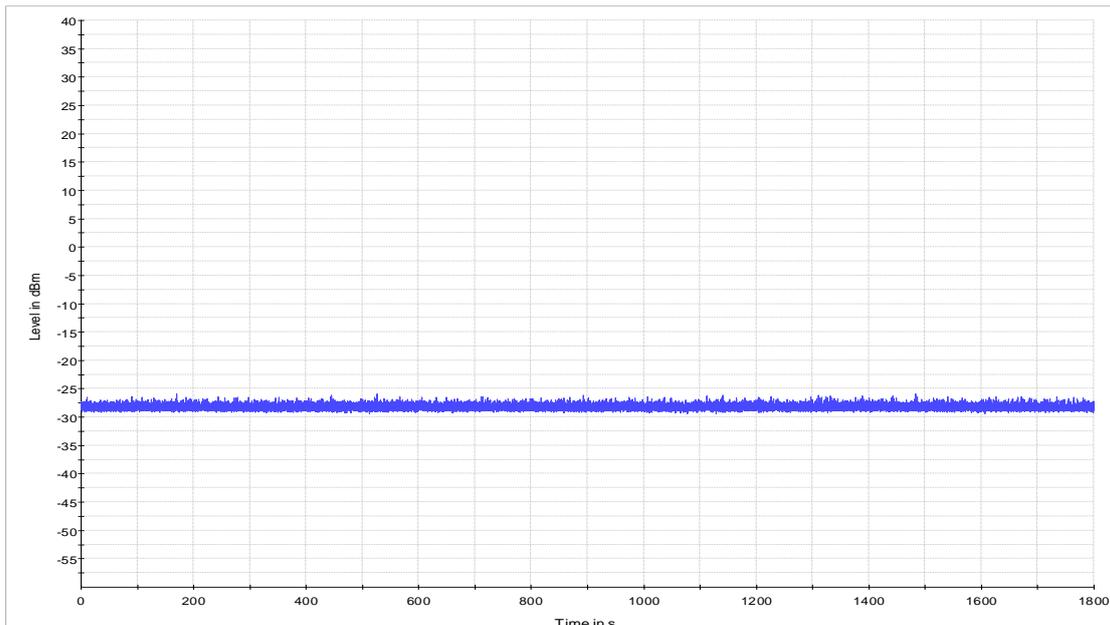

Date: 6.SEP.2016 08:53:08

**Channel loading data**

**Channel close and move period**

Channel Non Occupancy Period

DUT Frequency (MHz)	CCTT (s)	Limit CCTT (s)	Non Occupancy Time (s)	Limit Non Occupancy Time (s)	Result	Comment
5500.000000	0.060	0.200+0.06	1860.062	1800.000	PASS	

When the master device detected the radar pulse it changed channel and the EUT followed it automatically.

No emissions occurred after the channel move period or during the non-occupancy period.
