## 5. Test of Radiated Emission (Spurious emission)

Radiated emissions from 30 MHz to 1,000 MHz were measured with a bandwidth of 120 kHz according to the methods defines in ANSI C63.4-1992. The EUT was placed on a nonmetallic stand in the open-field site, 0.8 meter above the ground plane, as shown in section 5.3. The interface cables and equipment positions were varied within limits of reasonable applications to determine the positions producing maximum radiated emissions.

#### 5.2. Test Procedures

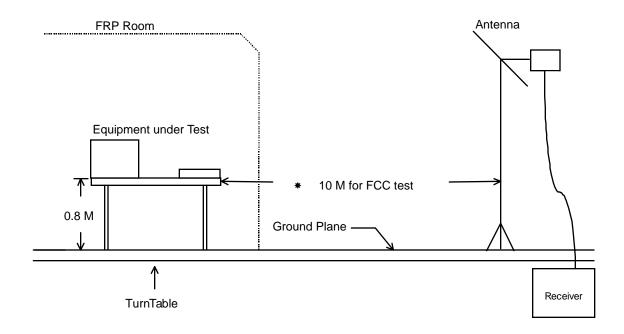

a. The EUT was placed on a rotatable table top 0.8 meter above ground.

- b. The EUT was set 10 meters from the interference receiving antenna which was mounted on the top of a variable height antenna tower.
- c. The table was rotated 360 degrees to determine the position of the highest radiation.
- d. The antenna is a half wave dipole and its height is varied between one meter and four meters above ground to find the maximum value of the field strength both horizontal polarization and vertical polarization of the antenna are set to make the measurement.
- e. For each suspected emission the EUT was arranged to its worst case and then tune the antenna tower (from 1 M to 4 M) and turn table (from 0 degree to 360 degrees) to find the maximum reading.
- f. Set the test-receiver system to Peak Detect Function and specified bandwidth with Maximum Hold Mode.
- g. If the emission level of the EUT in peak mode was 6 dB lower than the limit specified, then testing will be stopped and peak values of EUT will be reported, otherwise, the emissions which do not have 6 dB margin will be repeated one by one using the quasi-peak method and reported.

## 6.4. Test Result of Radiated Emission (Fundamental emission)

Equipment meets the technical specifications of 15.209

Frequency Range of Test: from 230KHz to 30 MHz

Test Distance: 3 M Temperature: 27

Relative Humidity: 55% RH Test Date :Sep. 21, 2000

Limits at 3 meters are calculated by following methed:

for the limit at 345Khz per 15.209 is 2400/345=6.957uV/m at 300m, To determine the level at the 3m test distance take 20 log (6.957)=16.85dBuV/m and then per 15.31 (f)(2) a 40dB/decade correction factor may be used below 30Mhz giving a 3m limit of 96.85dBuV/m.

- Emission level (dBuV/m)=20log emission level (uV/m)
- Sample Calculation at 0.345MHz Corrected Reading = 0.1+ 68.4= 68.5 (dBuV/m)
- Remark: The R&S test receiver will automatically offset the antenna factor, therefore, the reading value shown on the R&S test receiver is included receiving value added antenna factor.

#### Remark:

- 1. Data shown in above three rows represents three orthogonal (X, Y, Z).
- 2. Testing at Vertical Polarity, emission was too low to be detected.
- 3. This emission was base on measurements employing an average detector
