Subject: Maximum Permissible Exposure calculations for **FCC ID: FUV-ISA-003-1**

The AMP Wireless ISA card can use four different antennas:

Centurion 1.0 dBi Omnidirectional Antenna - Certified on original application
Cushcraft 3.0 dBi Omnidirectional Antenna
Xertex 9.0 dBi Patch Antenna
Mobile Mark 9.0 dBi Omnidirectional Antenna
Amp 13.5 dBi Yagi Antenna

No duty cycle is used in the following calculations.

For an Isotropic radiator the surface area of a sphere can be used to determine the area over which the transmitter energy is radiated.

$$\text{Surface area of a sphere} = 4\pi r^2$$

In the case where there is antenna gain, the worst case energy density is increased by the antenna gain. In this case, the exposure level can be calculated as follows:

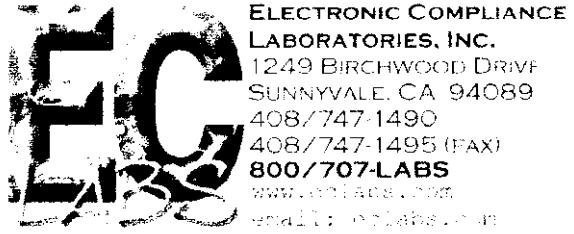

$$\text{MPE distance} = ((\text{output power} * \text{duty cycle} * 10^{(\text{antenna gain}/10)}) / (4\pi * \text{Exposure Limit (mW/cm}^2)))^{1/2}$$

Centurion 1.0 dBi	- MPE = $(100 * 1.25/4 * 3.14 * .6)^{1/2}$	= 4.1 cm = 1.6 in.
Cushcraft 3.0 dBi	- MPE = $(100 * 1.99/4 * 3.14 * .6)^{1/2}$	= 5.2 cm = 2.0 in.
Xertex 9.0 dBi	- MPE = $(100 * 7.94/4 * 3.14 * .6)^{1/2}$	= 10.3 cm = 4.0 in.
Mobile Mark 9.0 dBi	- MPE = $(100 * 7.94/4 * 3.14 * .6)^{1/2}$	= 10.3 cm = 4.0 in.
Amp 13.5 dBi	- MPE = $(100 * 22.38/4 * 3.14 * .6)^{1/2}$	= 17.2 cm = 6.8 in.

If you have any questions please do not hesitate to call me.

Sincerely,

Chris Byleckie
Technical Director

**Amp Incorporated
Wireless ISA Adapter
FCC ID: FUV-ISA-003-1**

Antennas used with the wireless ISA card

Centurion	P/N CAF28777	1.0 dBi Omnidirectional Antenna
Cushcraft	P/N S2403BP	3.0 dBi Omnidirectional Antenna *
Cushcraft	P/N S2403BH	3.0 dBi Omnidirectional Antenna *
Mobile Mark	P/N OD9-2400	9.0 dBi Omnidirectional
Xertex	P/N 364015-2	9.0 dBi Patch Antenna
AMP	P/N 364016	13.5 dBi Yagi Antenna

* These antennas are identical except for the attachment method.

S2403BP is pole mounted

S2403BH is hinge mounted

Cushcraft 1.0 dBi Omnidirectional Antenna EIRP

EIRP = +20.0 dBm (peak power) +1.0 (antenna gain) = 21.0 dBm / 125 mW

Limit +36 dBm / 4 Watts

1.0 Verification of Compliance

Purpose of Test: To validate compliance of four additional antennas for the Wireless ISA Adapter:

Xertex Technologies 9 dBi Patch Antenna
AMP 13.5 dBi YAGI Antenna
Cushcraft 3 dBd Omnidirectional Antenna
Mobile Mark 9 dBi Omnidirectional Antenna

Description: Wireless ISA adapter Card

Part Number: 364003-1

Serial Number: N/A0020A60029BB

Applicant: Amp Inc.

Type of Test: CFR 47 Part 15, Section 15.205 and 15.247; Class II Permissive Change Addendum to Application for FCC ID# FUV-ISA-003-1

Date of Test: November 29, 1997

Tested By: Chip Matheny

The above equipment was tested by Electronic Compliance Laboratories, Inc. and found to be in compliance with the requirements set forth in the FCC Rules and Regulations, Part 15, Subpart C and 15.247 and 15.205. The equipment, test in the configuration described in this report, shows that the maximum emission levels emanating from this equipment are within the compliance requirements.

Date: _____

Chris Byleckie
Technical Director

2.0 General Information

Applicant: Amp Inc.
P.O Box 3608
MS 258-27
Harrisburg, PA 17105

Contact Person: Rex Kesser

Equipment Under Test: Wireless ISA Adapter

Part Number: 364003-1

FCC ID No: FUV-ISA-003-1

Report Number: P711039

Date of Test: November 29, 1997

Manufacturer: Amp Inc.

Type of Test: FCC part 15, Subpart C, 15.205; Class II Permissive Change
Addendum to Application for FCC ID# FUV-ISA-003-1

Frequency Range: 2400 MHz to 2483.5 MHz

Operating Frequencies: 2402 MHz to 2480 MHz

Summary

Pass/Fail: Passed

15.205 Operation within the 2400 - 2483.5 MHz band:

The EUT met all the requirements for 15.205. See attached data and plots.
The EUT was placed on a 3 meter OATS.

3.0 Test Facility

Name: Electronic Compliance Laboratories

Location: 1249 Birchwood Drive
Sunnyvale, CA 94089

Site Filing: A site description is on file at the Federal Communications
Commission
P.O. Box 429
Columbia, MD 21045

Types of Sites: Open Field Radiated and Indoor (Screen Room).
Line Conducted: All sites are constructed and calibrated to meet
ANSI C63.4-1994 requirements.
Test facility is recognized by the National Voluntary Laboratory
Accreditation Program for satisfactory compliance with criteria
established in Title 15, Part 285 Code of Federal Regulations.

NVLAP Code: 20089 effective through: March 31, 1998

4.0 Test Equipment

The following list contains equipment used at EC Laboratories, Inc. for compliance testing. The equipment conforms to the American National Standard Specifications for Electromagnetic Interference and Field Strength Instrumentation from 10 kHz to 1000 MHz.

Description	Manufacturer	S/N	Model No.	Cal. Due Date
Pre-amp	HP	3008A00527	8449B	4/5/98
Spectrum Analyzer	HP	3137A01183	8563A	5/22/98
Plotter	HP	2644V00365	7470A	N/A
Horn Antenna	EM	6231	RGA-60	6/6/98

HP = Hewlett Packard

EM = Electro Metrics

The antenna used at the time the data was taken is indicated on each data page. The antenna height and polarization are also noted on the data pages.

The calibration of the measuring instruments, including any accessories that may effect such calibration, are checked frequently to assure their accuracy. Adjustments are made and correction factors applied in accordance with instructions contained in the manual for the measuring instrument.

5.0 Data Reporting Format

The measurement results are expressed in accordance with FCC Part-15, Subpart C; Class B limits, where applicable, are presented in tabular or graphical form.

6.0 Detector Functions

On any frequency or frequencies below or equal to 1000 MHz, the limits shown below are based on measuring equipment employing a CISPR quasi-peak detector function and related measurement bandwidths.

On any frequency or frequencies above 1000 MHz, the radiated limits shown below are based on the use of measuring equipment employing an average detector function.

EC Laboratories uses the Peak detection mode for normal testing and initial screening of the EUT. The Peak detection mode will produce a measurement value that is always greater than, or equal to, the quasi-peak or average detection mode. Whenever the measurement value is 6 dB below the applicable limit or greater, the appropriate detector function will be employed and recorded.

7.0 Frequency Range of Investigation

The spectrum was investigated up to the frequency specified in the following table according to the highest clock frequency generated in the device.

<u>Highest Frequency Used (Clock)</u>	<u>Upper Limit of Range Measured</u>
Below 1.705 MHz	30 MHz
1.705 to 108 MHz	1000 MHz
108 to 500 MHz	2000 MHz
500 to 1000 MHz	5000 MHz
Above 1000 MHz	5th Harmonic or 40 GHz (Whichever is Lower)

8.0 Summary of Measurements

Summary of Measurements for a Spread-Spectrum System, 2400 - 2483.5 MHz

CFR Title 47, Part 15.205

Manufacturer Amp Inc.
 P O Box 3608
 MS 258-27
 Harrisburg, PA 17105

Contact: Rex Kesser

FCC ID FUV-ISA-003-1

Test Report Number: P711039

15.205 Restricted Bands - Emissions Within Restricted Bands

The EUT was placed on a wooden table resting on a turntable. The wooden table was approximately 1 meter above the ground plane of the 3 meter test site

The search antenna was located 1 meters from the EUT. With the EUT transmitting continuously, and with the spectrum analyzer in MAX HOLD mode, the turntable was rotated and the search antenna was raised and lowered in an attempt to maximize the received radiated emission level. Search antenna polarity was changed from vertical to horizontal and the test was repeated. Peak measurements were made using an RBW = VBW = 1MHz. Average Measurements were made with an RBW = 1MHz and a VBW = 10 Hz.

15.247(b) MAXIMUM PEAK OUTPUT POWER

Power = +20.0 dBm (peak reading)

Limit: +30 dBm / 1 W maximum power

Xertex 9 dBi Patch antenna.

EIRP = +20.0 (peak power) +9.0 (peak gain, dBi) = +29.0 dBm / 794 mW EIRP

Limit: +36 dBm / 4 W maximum EIRP

Cushcraft 3dBd Omnidirectional antenna.

EIRP = +20.0 (peak power) +3.0 (peak gain, dBi) = +23.0 dBm / 200 mW EIRP

Limit: +36 dBm / 4 W maximum EIRP

Amp 13.5 YAGI antenna

EIRP = +20.0 (peak power) +13.5 (peak gain, dBi) = +33.5dBm / 2.24 W EIRP

Limit: +36 dBm / 4 W maximum EIRP

Mobile Mark 9 dBi Omnidirectional Antenna

EIRP = +20.0 (peak power) +9.0 (peak gain, dBi) = +29.0 dBm / 794 mW EIRP

Limit: +36 dBm / 4 W maximum EIRP

COMMUNICATIONS ANTENNAS

CD Series with
Reflector Option Kit

CD12
Series
Antenna

OD Series Omni Antenna

For WLAN, Video, PCS, and Data Systems

- 6 dBi, 9 dBi & 12 dBi antennas provide uniform omni coverage
- Unique design allows economical build out
- Mounting kit includes all hardware needed
- Reflector option provides directional beamshaping & increased performance

(2)

Amp PART # 364014 - 4

The CD Series Antennas are optimized for use in a wide variety of wireless systems. They are usable in point to point, multi-point and broadcast configurations. Typical uses include WLAN access points or bridge, PCS Micro-cell, and for video surveillance transmitters.

These antennas consist of a collinear array with elements stacked vertically. Unique phasing cancels out-of-phase current distribution, improving system performance. This design maintains an omni pattern in the horizontal plane. The CD Series are free space antennas and can be mounted anywhere, no ground plane is required.

An option for the CD series is a reflector kit that beam shapes the omni pattern into a directional cardoid shape. This can result in improved performance for gain, and isolation for reduced interference.

The low profile back radome (1.15" diameter) makes the CD Series durable and rugged. They can withstand the harshest environments of snow, wind, rain and ice. The feed assembly is made of precision machined aluminum components and is treated for weather protection. The CD Series comes with all the hardware needed to install

it to a mast. Customized hardware is also available for unique mounting needs. For ISM, special connectors and models with cable are available including reverse polarity please consult factory.

Model Numbers

Model	Freq. (MHz)	Gain	Applications
OD6-1800	1700-1900	6 dBi	GSM, Surveillance
OD9-1800	1700-1900	9 dBi	GSM, Surveillance

9 dBi Patch
**2.4 GHz WLAN
Directional Antenna**

(1)

Electrical Specifications

Frequency:	2.4 to 2.5 GHz
Gain:	9 dBi
Typical Bandwidth (1.5:1 VSWR):	140 MHz
Polarization:	Linear (Vertical or Horizontal)
3dB Beamwidth (typical):	
E-Plane:	55 degrees
H-Plane:	60 degrees
Pattern:	Directional

Mechanical Specifications

Dimensions:	4.88 x 4.88 x 7/8 inches
Connector:	N-Female
Cable Length:	12 inches
Color:	Shell White
Environmental:	Indoor/Outdoor Use

AMP PART # 364015-2
9 dBi Patch Antenna

a

PART NO.	CABLE	CONNECTOR	NOTE: INCLUDES

9 dBi Patch Antenna

APPENDIX E

DUTY CYCLE INFORMATION

Duty Cycle Analysis for Proxim's RangeLAN2/PCMCIA:

The following section analyses in detail the duty cycle performance experienced by a RangeLAN2/PCMCIA LAN adapter. It should be noted that all of Proxim's RangeLAN2 family of products use the same protocols and therefore show the same timing characteristics. The protocols are controlled by the firmware in the LAN adapter.

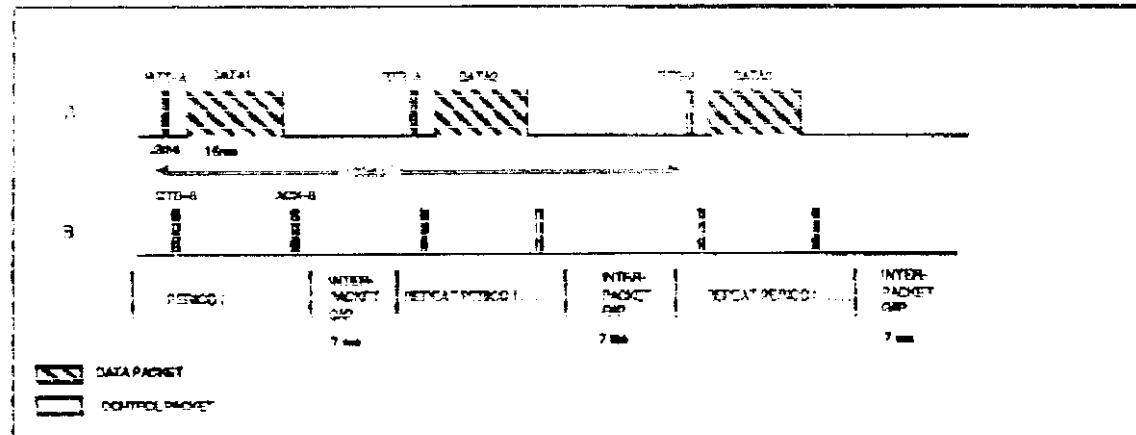

Worst case duty cycle timing for a given transmitter occurs when only two computers are actively communicating in a network. If more computers are present, each transmitter will have to back off, as the additional computers gain access to the channel. Duty cycle for every transmitter in the network is thus reduced if more computers are present.

The topology we will therefore describe and the one of interest to the FCC is one with two computers ("A" and "B") communicating via Proxim's RangeLAN2/PCMCIA (as shown below).

Computer "A" duty cycle will be the highest when it is the one sending data. In this case Computer "B" will spend most of its time in receive mode, occasionally responding to "A" with some control information. "B" duty cycle will therefore be much lower than "A".

The timing diagram shown below depicts a worst case situation in which computer "A" is transferring a large file to computer "B".

During a file transfer from computer "A" and computer "B" the following events take place:

PERIOD 1

- 1) "A" sends a Request-To-Send (RTS) to computer "B" requesting permissions to send a packet.
- 2) If "B" receives the RTS message it will respond with a Clear-To-Send message to "A" indicating that "A" can proceed with the transmission of the packet.

- 3) Once "A" receives the CTS from "B" it then sends a packet of data of the file being transferred.
- 4) If "B" receives the packet without errors it responds with a positive Acknowledgment (ACK). If errors are detected, "B" responds with a Negative Acknowledgment (NACK).

INTER PACKET GAP (IPG)

The Inter Packet Gap is the amount of time that a station has to wait on the average to gain access to the media (the ether). Even if a station has data ready to be sent it will have to wait this period of time before entering a sent period. This number is typically .7 ms.

Each transmission follows a similar pattern: an IPG is followed by an RTS which is answered by a CTS which is followed by the data packet and is finally acknowledged with an ACK message.

Under worse case conditions the following applies: Control packets (RTS, CTS and ACK) are .64 ms long (.64 bytes @ 800 kbs). Maximum length data packets are 15 ms long (1500 bytes @ 800 kbps). There is a .25 ms latency between the completion of a packet transmission from "A" and the beginning of a packet transmission from "B" (radio turn around time -TAT).

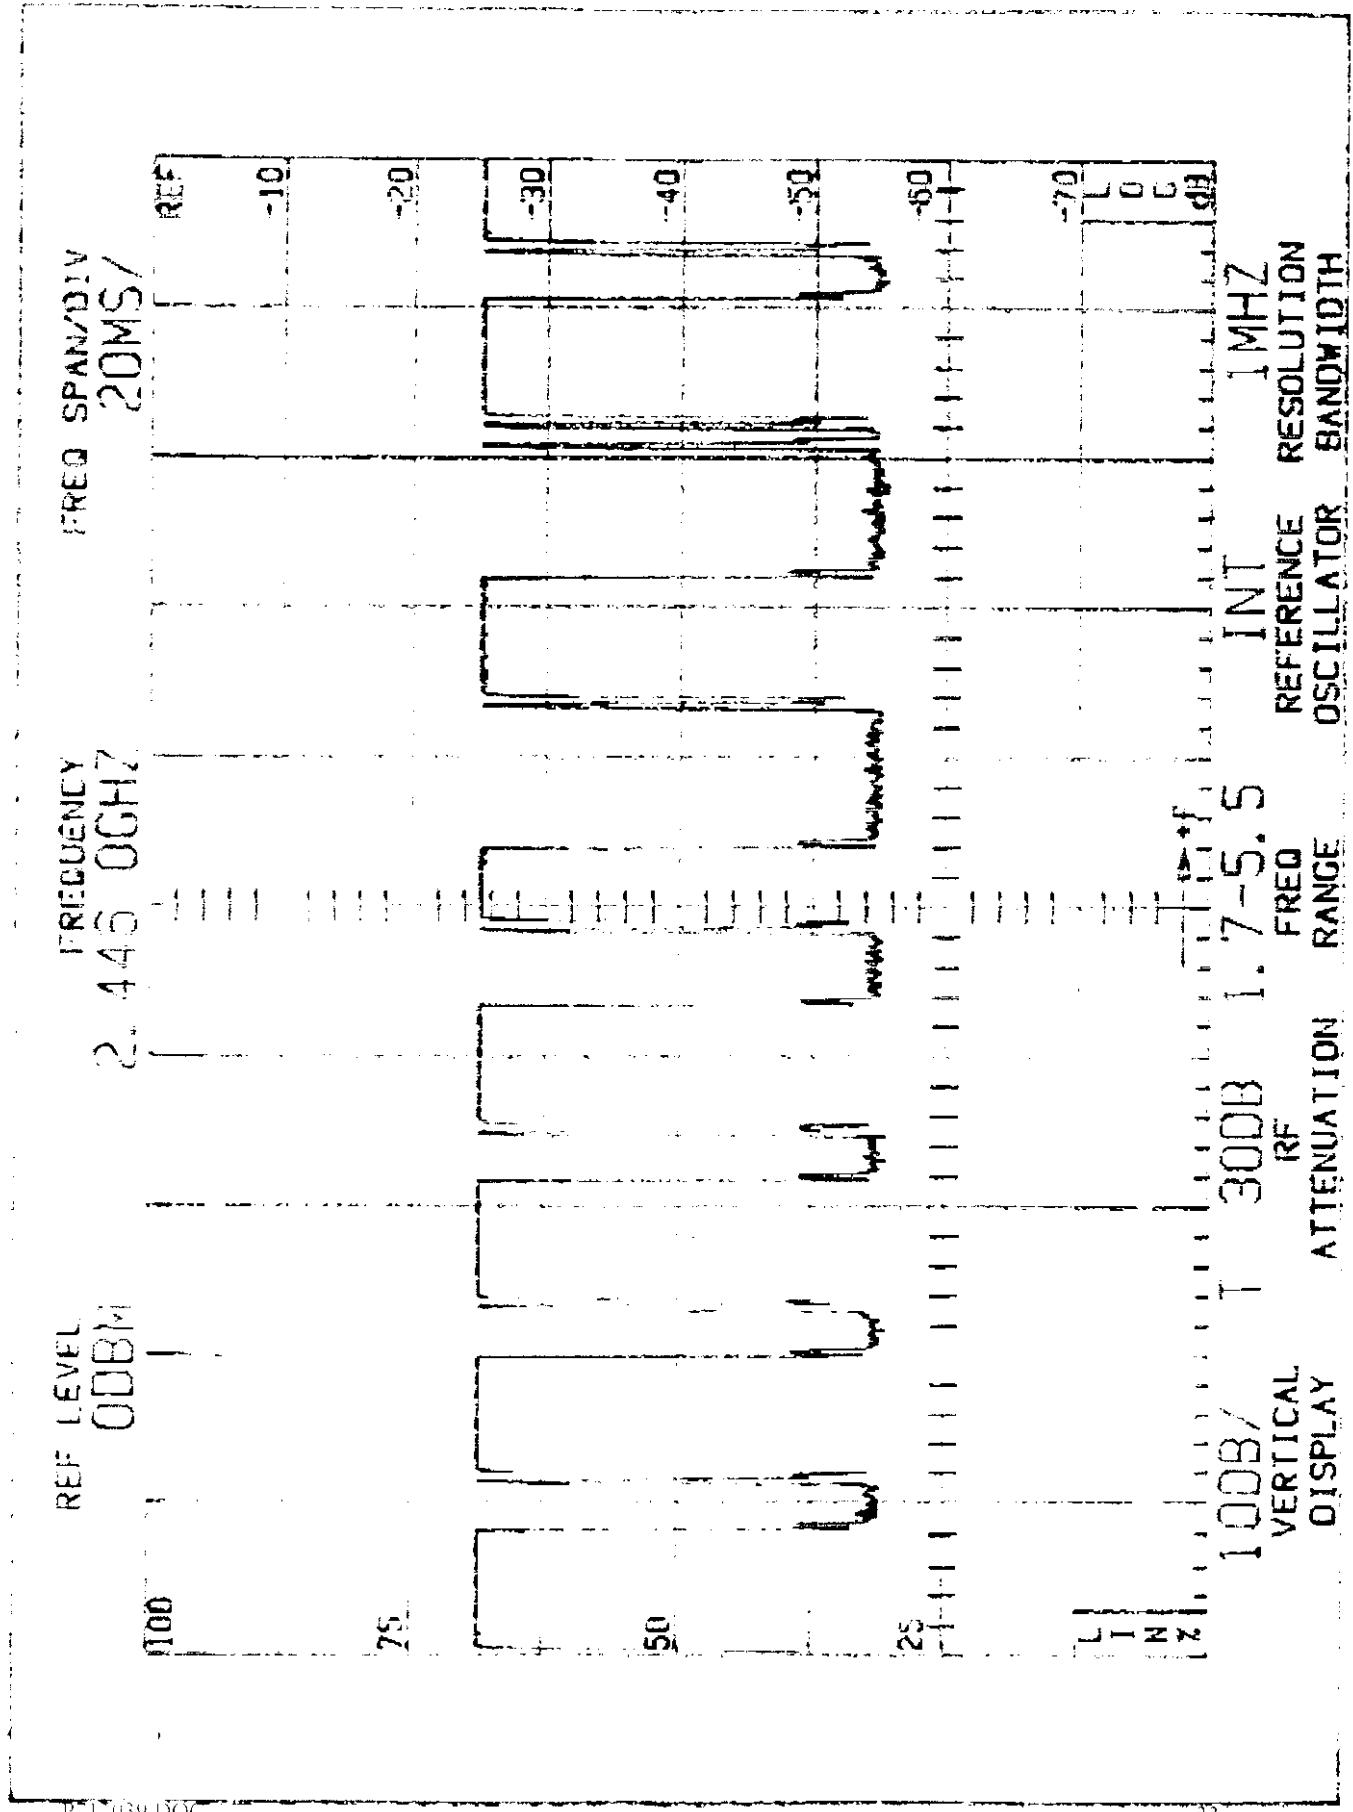

Since on a worst case scenario this cycle repeats itself, the duty cycle is given by the time a station is transmitting during each cycle and the total cycle time.

$$\begin{aligned}\text{Total Cycle Time} &= \text{IPG} + \text{RTS(A)} + \text{TAT} + \text{CTS(B)} + \text{TAT} + \text{DATA(A)} + \text{TAT} + \text{ACK(B)} = \\ &= .7 + .64 + .25 + .64 + .25 + 15 + .25 + .64 = 24.87\end{aligned}$$

$$\begin{aligned}\text{Transmit Time} &= \text{RTS(A)} + \text{DATA(A)} = \\ &= .64 + 15 = 15.64\end{aligned}$$

The resulting duty cycle is therefore $\approx 15.64/24.87 = 63\%$

The plot shown attached was taken using a spectrum analyzer in zero span and with an antenna positioned near computer "A". Transmissions from "B" are not discernible on the photograph due to the fact that computer "B" was some distance from the spectrum analyzer and its signal is therefore below the noise level. Only "A" transmissions are shown on the photograph.
