### **3.0 Test Results**

#### **3.1 Emission**

##### **3.1.1 Radiated Emissions**

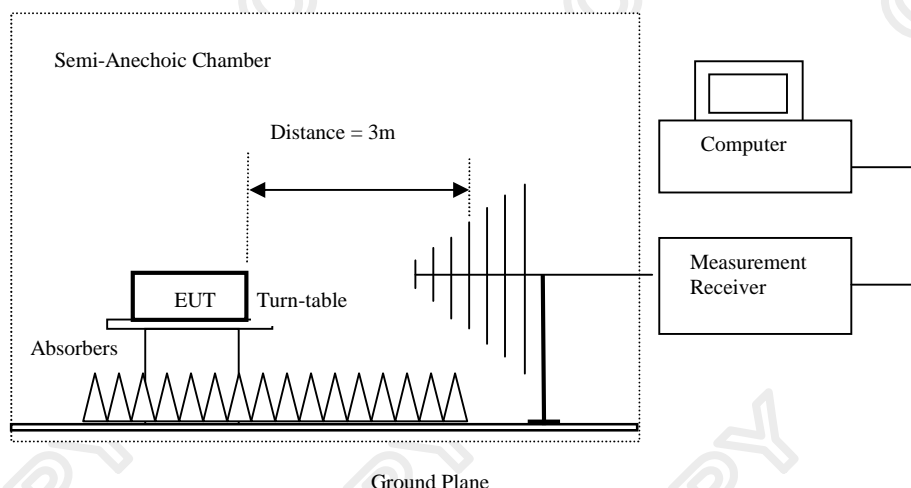

Test Requirement: FCC 47CFR 15.249  
Test Method: ANSI C63.4:2009  
Test Date: 2010-12-13  
Mode of Operation: Tx mode

#### **Test Method:**

The sample was placed 0.8m above the ground plane of semi-anechoic Chamber\*. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, rotating turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results of the following pages.

\* Semi-anechoic chamber located on the G/F of The Hong Kong Standards and Testing Centre Ltd. with a metal ground plane filed with the FCC pursuant to section 2.948 of the FCC rules, with Registration Number: 607756.

#### **Test Setup:**

Absorbers placed on top of the ground plane are for measurements above 1000MHz only.

#### **Duty Cycle Correction During 100msec**

Each function key sends a different series of characters, but each packet period (100msec) never exceeded a series of 8 long (1.52msec) and 82 short (480.96µsec) pulses. Assuming any combination of short and long pulses may be obtained due to encoding the worse case transmit duty cycle would be considered  $(8 \times 1.52\text{msec}) + (82 \times 480.96 \times 10^{-3})\text{msec}$  per 100msec = 51.59% duty cycle. Figure A through C shows the characteristics of the pulses train for one of these functions.

Remarks:

Duty Cycle Correction =  $20\text{Log}(0.5159) = -5.74\text{dB}$

Duty Cycle Correction = -20dB, if the calculation duty cycle correction  $> -20\text{dB}$ .
