### 1.1 Maximum Results Found during SAR Evaluation

The equipment is deemed to fulfil the requirements if the measured values are less than or equal to the limit.

#### 1.1.1 Head Configuration

| Ch / f (MHz) | Power    | Position | Limit    | Measured  | Result        |
|--------------|----------|----------|----------|-----------|---------------|
| 1175/1908.75 | 23.7 dBm | Tilted   | 1.6 mW/g | 1.17 mW/g | <b>PASSED</b> |

#### 1.1.2 Body Worn Configuration

| Ch / f (MHz) | Power    | Accessory | Limit    | Measured  | Result        |
|--------------|----------|-----------|----------|-----------|---------------|
| 25/1851.25   | 23.7 dBm | CSL-28    | 1.6 mW/g | 0.49 mW/g | <b>PASSED</b> |

#### 1.1.3 Measurement Uncertainty

|                                            |                |
|--------------------------------------------|----------------|
| <b>Combined Standard Uncertainty</b>       | <b>± 13.6%</b> |
| <b>Extended Standard Uncertainty (k=2)</b> | <b>± 27.1%</b> |

### 2.1 Picture of Phone

### 2.2 Description of the Antenna

|          |                                                   |
|----------|---------------------------------------------------|
| Type     | Internal integrated antenna                       |
| Location | Inside the back cover, near the top of the device |

### 2.3 Battery Options

There is only one battery option available for tested device, Li-ion battery BLB-2.

### 2.4 Body Worn Accessories

Following body worn accessory is available for GMLNSD-5FX:

- CSL-28

### 3. TEST CONDITIONS

#### 3.1 Ambient Conditions

|                                           |      |
|-------------------------------------------|------|
| Ambient temperature (°C)                  | 22±1 |
| Tissue simulating liquid temperature (°C) | 22±1 |
| Humidity (%)                              | 35   |

#### 3.2 RF characteristics of the test site

Tests were performed in a fully enclosed RF shielded environment.

#### 3.3 Test Signal, Frequencies, and Output Power

The device was controlled by using a radio tester. Communication between the device and the tester was established by air link.

In all operating bands the measurements were performed on lowest, middle and highest channels.

The phone was set to maximum power level during the all tests and at the beginning of the each test the battery was fully charged.

DASY3 system measures power drift during SAR testing by comparing e-field in the same location at the beginning and at the end of measurement. These records were used to monitor stability of power output.

### 4. DESCRIPTION OF THE TEST EQUIPMENT

The measurements were performed with an automated near-field scanning system, DASY3, manufactured by Schmid & Partner Engineering AG (SPEAG) in Switzerland.

| Test Equipment                 | Serial Number | Due Date |
|--------------------------------|---------------|----------|
| DASY3 DAE V1                   | 371           | 10/02    |
| E-field Probe ET3DV6           | 1381          | 10/02    |
| Dipole Validation Kit, D1900V2 | 511           | 02/03    |

E-field probe calibration records are presented in Appendix C.

Additional equipment needed in validation:

| Test Equipment                     | Model                    | Serial Number | Due Date |
|------------------------------------|--------------------------|---------------|----------|

| Power Sensor                       | R&S NRT-Z44              | 835374/021    | 05/02    |
| Thermometer                        | DO9416                   | 1505985462    | -        |
| Vector Network Analyzer            | Anritsu 37347A           | 992604        | 01/03    |
| Transmission Line Dielectric Probe | Damaskos T1500           | -             | -        |

Equipment used to measure conducted power output:

| Test Equipment | Model          | Serial Number | Due Date |
|----------------|----------------|---------------|----------|
| Power Meter    | Agilent E4416A | GB41050565    | 07/02    |
| Power Sensor   | Agilent E9327A | US40440339    | 05/02    |

#### 4.1 System Accuracy Verification

The probes are calibrated annually by the manufacturer. Dielectric parameters of the simulating liquids are measured using a Damaskos Inc. transmission line model T1500 and Anritsu 37347A vector network analyzer.

The SAR measurement of the DUT were done within 24 hours of system accuracy verification, which was done using the dipole validation kit. Power level of 250 mW was supplied to a dipole antenna placed under the flat section of SAM phantom. The antenna is matched for use near flat phantoms filled with tissue simulating solution. It is manufactured by Schmid & Partner Engineering AG. Length of the dipole is 68 mm with overall height of 300mm. A specific distance holder is used in the positioning of the antenna to ensure correct spacing between the phantom and the dipole. The validation results are in the table below and printout of the validation test is presented in Appendix A. Manufacturer's reference dipole data is presented in Appendix C. All the measured parameters were within the specification.

| Tissue | $f$<br>(MHz) | Description      | SAR<br>(W/kg), 1g | Dielectric Parameters |                | Temp<br>(°C) |
|--------|--------------|------------------|-------------------|-----------------------|----------------|--------------|
|        |              |                  |                   | $\epsilon_r$          | $\sigma$ (S/m) |              |
| Head   | 1900         | Measured         | 11.4              | 38.0                  | 1.44           | 22           |
|        |              | Reference Result | 10.7              | 39.2                  | 1.47           | N/A          |
| Muscle | 1900         | Measured         | 11.4              | 52.0                  | 1.55           | 22           |
|        |              | Reference Result | 10.6              | 53.5                  | 1.46           | N/A          |

#### 4.2 Tissue Simulants

All dielectric parameters of tissue simulants were measured within 24 hours of SAR measurements. The depth of the tissue simulant in the ear reference point of the phantom was 15cm  $\pm$  5mm during all the tests.

#### 4.2.1 Head Tissue Simulant

The composition of the brain tissue simulating liquid for 1900MHz

|                    | Recommended Values | 53.3                           | 1.52                             | 20-26                |

Recommended values are adopted from OET Bulletin 65 (97-01) Supplement C (01-01).

### 4.3 Phantoms

"SAM v4.0" phantom", manufactured by SPEAG, was used during the measurement. It has fiberglass shell integrated in a wooden table. The shape of the shell corresponds to the phantom defined by SCC34-SC2. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. Reference

markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot.

The thickness of phantom shell is 2 mm except for the ear, where an integrated ear spacer provides a 6 mm spacing from the tissue boundary. Manufacturer reports tolerance in shell thickness to be  $\pm 0.1$ mm.

### 5. DESCRIPTION OF THE TEST PROCEDURE

#### 5.1 Test Positions

The device was placed in holder using a special positioning tool, which aligns the bottom of the device with holder and ensures that holder contacts only to the sides of the device. After positioning is done, tool is removed. This method provides standard positioning and separation, and also ensures free space for antenna.

Device holder was provided by SPEAG together with DASY3.

##### 5.1.1 Against Phantom Head

Measurements were made on both the "left hand" and "right hand" side of the phantom.

The device was positioned against phantom according to OET Bulletin 65 (97-01) Supplement C (01-01). Definitions of terms used in aligning the device to a head phantom are available in IEEE Draft Standard P1528-2001 "Recommended Practice for Determining the Spatial-Peak Specific Absorption Rate (SAR) in the Human Body Due to Wireless Communications Devices: Experimental Techniques"

#### 5.1.1.1 Initial Ear Position

The device was initially positioned with the earpiece region pressed against the ear spacer of a head phantom parallel to the “Neck-Front” line defined along the base of the ear spacer that contains the “ear reference point”. The “test device reference point” is aligned to the “ear reference point” on the head phantom and the “vertical centerline” is aligned to the “phantom reference plane”.

#### 5.1.1.2 Cheek Position

“Initial ear position” alignments are maintained and the device is brought toward the mouth of the head phantom by pivoting along the “Neck-Front” line until any point on the display, keypad or mouthpiece portions of the handset is in contact with the phantom or when any portion of a foldout, sliding or similar keypad cover opened to its intended self-adjusting normal use position is in contact with the cheek or mouth of the phantom.

#### 5.1.1.3 Tilt Position

In the “Cheek Position”, if the earpiece of the device is not in full contact with the phantom’s ear spacer and the peak SAR location for the “cheek position” is located at the ear spacer region or corresponds to the earpiece region of the handset, the device is returned to the “initial ear position” by rotating it away from the mouth until the earpiece is in full contact with the ear spacer. Otherwise, the device is moved away from the cheek perpendicular to the line passes through both “ear reference points” for approximate 2-3 cm. While it is in this position, the device is tilted away from the mouth with respect to the “test device reference point” by 15°. After the tilt, it is then moved back toward the head perpendicular to the line passes through both “ear reference points” until the device touches the phantom or the ear spacer. If the antenna touches the head first, the positioning process is repeated with a tilt angle less than 15° so that the device and its antenna would touch the phantom simultaneously.

### 5.1.2 Body Worn Configuration

Body worn accessory CSL-28 was tested for the FCC RF exposure compliance. The phone was positioned into carrying case and placed below of the flat phantom. Headset was connected during measurements. Since CSL-28 has opening for headset connector, headset can be connected only if the antenna of the DUT is facing away from the phantom.

## 5.2 Scan Procedures

First coarse scans are used for quick determination of the field distribution. Next a cube scan, 5x5x7 points; spacing between each point 8x8x5 mm, is performed around the highest E-field value to determine the averaged SAR-distribution over 1g.

## 5.3 SAR Averaging Methods

The maximum SAR value is averaged over its volume using interpolation and extrapolation.

The interpolation of the points is done with a 3d-Spline. The 3d-Spline is composed of three one-dimensional splines with the "Not a knot" -condition [W. Gander, Computermathematik, p. 141-150] (x, y and z -directions) [Numerical Recipes in C, Second Edition, p 123].

The extrapolation is based on least square algorithm [W. Gander, Computermathematik, p.168-180]. Through the points in the first 30 mm in all z-axis, polynomials of order four are calculated. This polynomial is then used to evaluate the points between the surface and the probe tip. The points, calculated from the surface, have a distance of 1mm from one another.

## 6. MEASUREMENT UNCERTAINTY

### 6.1 Description of Individual Measurement Uncertainty

#### 6.1.1 Assessment Uncertainty

| Uncertainty description                    | Uncert. value % | Probability distribution | Div.       | $c_i^1$         | Stand. uncert (1g) % | $v_i^2$ or $v_{eff}$ |

## 7. RESULTS

Corresponding SAR distribution printouts of maximum results in tilted position and z-plots of the maximum results are shown in Appendix B. The SAR distributions are substantially similar or equivalent to the plots submitted regardless of used channel.

In the cheek position two almost equal SAR peaks were found and both were evaluated. Results of higher peaks are in the table. Secondary peak evaluation results are marked to the SAR plots and therefore all cheek position plots are included.

### 7.1 Head Configuration

| Mode         | Channel/<br><i>f</i> (MHz) | Power<br>(dBm) | SAR, averaged over 1g (mW/g) |        |            |        |
|--------------|----------------------------|----------------|------------------------------|--------|------------|--------|
|              |                            |                | Left-hand                    |        | Right-hand |        |
|              |                            |                | Cheek                        | Tilted | Cheek      | Tilted |
| CDMA<br>1900 | 25/1851.25                 | 23.7           | 1.07                         | 0.98   | 1.03       | 0.88   |
|              | 600/1880.00                | 23.5           | 1.08                         | 1.07   | 1.06       | 0.86   |
|              | 1175/1908.75               | 23.7           | 1.16                         | 1.17   | 1.09       | 1.16   |

### 7.2 Body Worn Configuration

| Mode         | Channel/<br><i>f</i> (MHz) | Power<br>(dBm) | SAR, averaged over 1g (mW/g) |
|--------------|----------------------------|----------------|------------------------------|
|              |                            |                | CSL-28                       |
| CDMA<br>1900 | 25/1851.25                 | 23.7           | 0.49                         |
|              | 600/1880.00                | 23.5           | 0.41                         |
|              | 1175/1908.75               | 23.7           | 0.43                         |

**Calibration Certificate(s)**

## Calibration Certificate

### Dosimetric E-Field Probe

Type:

**ET3DV6**

Serial Number:

**1381**

Place of Calibration:

**Zurich**

Date of Calibration:

**October 25, 2001**

Calibration Interval:

**12 months**

Schmid & Partner Engineering AG hereby certifies, that this device has been calibrated on the date indicated above. The calibration was performed in accordance with specifications and procedures of Schmid & Partner Engineering AG.

Wherever applicable, the standards used in the calibration process are traceable to international standards. In all other cases the standards of the Laboratory for EMF and Microwave Electronics at the Swiss Federal Institute of Technology (ETH) in Zurich, Switzerland have been applied.

Calibrated by:

*Nikolaus Meriana*

Approved by:

*Julian Kofja*

**DASY3**

**Dipole Validation Kit**

**Type: D1900V2**

**Serial: 511**

**Manufactured: October 20, 1999**  
**Calibrated: February 13, 2001**

## **1. Measurement Conditions**

The measurements were performed in the flat section of the new generic twin phantom filled with head simulating solution of the following electrical parameters at 1900 MHz:

|                       |            |            |
|-----------------------|------------|------------|
| Relative permittivity | 39.2       | $\pm 5\%$  |
| Conductivity          | 1.47 mho/m | $\pm 10\%$ |

The DASY3 System (Software version 3.1c) with a dosimetric E-field probe ET3DV6 (SN:1507, conversion factor 5.57 at 1800 MHz) was used for the measurements.

The dipole feedpoint was positioned below the center marking and oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging.

The dipole input power (forward power) was 250mW  $\pm 3\%$ . The results are normalized to 1W input power.

## **2. SAR Measurement**

Standard SAR-measurements were performed with the head phantom according to the measurement conditions described in section 1. The results (see figure) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values are:

averaged over 1 cm<sup>3</sup> (1 g) of tissue: 42.8 mW/g

averaged over 10 cm<sup>3</sup> (10 g) of tissue: 21.9 mW/g

Note: If the liquid parameters for validation are slightly different from the ones used for initial calibration, the SAR-values will be different as well. The estimated sensitivities of SAR-values and penetration depths to the liquid parameters are listed in the DASY Application Note 4: 'SAR Sensitivities'.

### 3. Dipole impedance and return loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

|                      |          |                                       |
|----------------------|----------|---------------------------------------|
| Electrical delay:    | 1.205 ns | (one direction)                       |
| Transmission factor: | 0.983    | (voltage transmission, one direction) |

The dipole was positioned at the flat phantom sections according to section 1 and the distance holder was in place during impedance measurements.

|                                  |                                |
|----------------------------------|--------------------------------|
| Feedpoint impedance at 1900 MHz: | $\text{Re}\{Z\} = 50.1 \Omega$ |
|                                  | $\text{Im}\{Z\} = -1.5 \Omega$ |
| Return Loss at 1900 MHz          | - 34.9 dB                      |

### 4. Measurement Conditions

The measurements were performed in the flat section of the new generic twin phantom filled with muscle simulating solution of the following electrical parameters at 1900 MHz:

|                       |            |            |
|-----------------------|------------|------------|
| Relative permittivity | 53.5       | $\pm 5\%$  |
| Conductivity          | 1.46 mho/m | $\pm 10\%$ |

The DASY3 System (Software version 3.1c) with a dosimetric E-field probe ET3DV6 (SN:1507, conversion factor 4.85 at 1800 MHz) was used for the measurements.

The dipole feedpoint was positioned below the center marking and oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging.

The dipole input power (forward power) was 250mW  $\pm 3\%$ . The results are normalized to 1W input power.

## **6. SAR Measurement**

Standard SAR-measurements were performed with the head phantom according to the measurement conditions described in section 1. The results (see figure) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values are:

averaged over 1 cm<sup>3</sup> (1 g) of tissue:      42.4 mW/g

averaged over 10 cm<sup>3</sup> (10 g) of tissue:      22.0 mW/g

Note: If the liquid parameters for validation are slightly different from the ones used for initial calibration, the SAR-values will be different as well.

## **7. Dipole impedance and return loss**

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

|                      |          |                                       |
|----------------------|----------|---------------------------------------|
| Electrical delay:    | 1.205 ns | (one direction)                       |
| Transmission factor: | 0.983    | (voltage transmission, one direction) |

The dipole was positioned at the flat phantom sections according to section 1 and the distance holder was in place during impedance measurements.

Feedpoint impedance at 1900 MHz:       $\text{Re}\{Z\} = 45.3 \Omega$

$\text{Im}\{Z\} = -1.0 \Omega$

Return Loss at 1900 MHz      - 25.6 dB

## **8. Handling**

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

Do not apply excessive force to the dipole arms, because they might bend. If the dipole arms have to be bent back, take care to release stress to the soldered connections near the feedpoint; they might come off.

After prolonged use with 40W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

# Validation Dipole D1900V2 SN:511, d = 10 mm
