Report by: *Valdis V. Liepa* Report Date of Issue: October 30, 2013  
Valdis V. Liepa, Ph.D.

---

**Results of testing completed on (or before) October 30, 2013 are as follows.**

**Emissions:** The transmitter fundamental emission meets the regulatory limit(s) by no less than 4.8 dB. Transmit chain spurious harmonic emissions comply by no less than 1.2 dB.

# 1 Test Specifications, General Procedures, and Location

## 1.1 Test Specification and General Procedures

The ultimate goal of TRW Automotive is to demonstrate that the Equipment Under Test (EUT) complies with the Rules and/or Directives below. Detailed in this report are the results of testing the TRW Automotive 209624-125, 209624-126 for compliance to:

Country/Region	Rules or Directive	Referenced Section(s)
United States	Code of Federal Regulations	CFR Title 47, Part 15.231
Canada	Industry Canada	RSS-210 and RSS-Gen

In association with the rules and directives outlined above, the following specifications and procedures are followed herein.

ANSI C63.4-2003	"Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz"
Industry Canada	"The Measurement of Occupied Bandwidth"

## 1.2 Test Location and Equipment Used

**Test Location** The EUT was fully tested by **The University of Michigan Radiation Laboratory**, 3228 EECS Building, Ann Arbor, Michigan 48109-2122 USA. The Test Facility description and attenuation characteristics are on file with the FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057A-1).

**Test Equipment** Pertinent test equipment used for measurements at this facility is listed in Table 1. The quality system employed at The University of Michigan Radiation Laboratory has been established to ensure all equipment has a clearly identifiable classification, calibration expiry date, and that all calibrations are traceable to the SI through NIST, other recognized national laboratories, accepted fundamental or natural physical constants, ratio type of calibration, or by comparison to consensus standards.

Table 1: The University of Michigan Radiation Laboratory Equipment List.

## 2 Configuration and Identification of the Equipment Under Test

### 2.1 Description and Declarations

The equipment under test is an automotive Tire Pressure Measurement (TPM) transmitter. The EUT is approximately 8 x 5 x 2 cm (approx.) in dimension, and is depicted in Figure 1. It is powered by a 3 VDC Lithium cell battery. In use, this device is permanently affixed as the valve-stem in the tire of a motor vehicle. Table 2 outlines provider declared EUT specifications.

Figure 1: Photos of EUT.

Table 2: EUT Declarations.

General Declarations			
<b>Equipment Type:</b>	TPM Transmitter	<b>Country of Origin:</b>	USA
<b>Nominal Supply:</b>	3 VDC	<b>Oper. Temp Range:</b>	Not Declared
<b>Frequency Range:</b>	315 MHz	<b>Antenna Dimension:</b>	5 x 0.7 cm (approx.)
<b>Antenna Type:</b>	tire stem	<b>Antenna Gain:</b>	< -10 dBi (declared)
<b>Number of Channels:</b>	1	<b>Channel Spacing:</b>	Not Applicable
<b>Alignment Range:</b>	315 ± 0.065 MHz	<b>Type of Modulation:</b>	ASK
United States			
<b>FCC ID Number:</b>	GQ4-67T	<b>Classification:</b>	DSC
Canada			
<b>IC Number:</b>	1470A-48T	<b>Classification:</b>	Remote Control Device, Vehicular Device

#### 2.1.1 EUT Configuration

The EUT is configured for testing as depicted in Figure 2.

#### 2.1.2 Modes of Operation

The EUT is capable of two key modes of operation. Upon manually activated LF interrogation (through the use of special LF tool at a vehicle dealership), the EUT responds with a single transmission containing a number of frames used to configure the device with the vehicle. When the EUT is placed in the vehicle tire and the vehicle drives, it can, in the worst case, periodically transmit where the duration of each transmission is always less than 1 second and the silent period between transmissions is at least 30 times the duration of the transmission, and never less than 10 seconds.

Figure 2: EUT Test Configuration Diagram.

### 2.1.3 Variants

There are two variants of the EUT. Both variants are electrically identical, but model 209624-125 employs a long valve stem, and model 209624-126 employs a short valve stem. Both variants are fully tested herein.

### 2.1.4 Test Samples

Three samples were provided for testing, two normal operating samples and one dismantled for photos. CW operation was enabled via LF interrogation with a custom LF code.

### 2.1.5 Functional Exerciser

Normal operating EUT functionality was verified by observation of transmitted signal from EUT after LF activation.

### 2.1.6 Modifications Made

There were no modifications made to the EUT by this laboratory.

### 2.1.7 Production Intent

The EUT appears to be a production ready sample, but for whom's clamshell housings are not yet laser welded.

### 2.1.8 Declared Exemptions and Additional Product Notes

The EUT is permanently installed in a transportation vehicle. As such, digital emissions are exempt from US and Canadian digital emissions regulations (per FCC 15.103(a) and IC correspondence on ICES-003).

The EUT also employs some modes of operation that alert the vehicle user of sudden changes in tire pressure. Such alert modes fall under FCC 15.231(a)(4), and may operate during the pendency of the alarm condition. A detailed list of all operating modes is included in the Description of Operation exhibit included in this application.

### 3 Emissions

#### 3.1 General Test Procedures

##### 3.1.1 Radiated Test Setup and Procedures

Radiated electromagnetic emissions from the EUT are first evaluated in our shielded fully anechoic chamber. Spectrum and modulation characteristics of all emissions are recorded, and emissions above 1 GHz are fully characterized. The anechoic chamber contains a set-up similar to that of our outdoor 3-meter site, with a turntable and antenna mast. Instrumentation, including spectrum analyzers and other test equipment as detailed in Section 1.2 are employed. After indoor pre-scans, emission measurements are made on our outdoor 3-meter Open Area Test Site (OATS). If the EUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.4 / CISPR-22 are followed. Alternatively, a layout closest to normal use (as declared by the provider) is employed if the resulting emissions appear to be worst-case in such a configuration. See Figure 3. All

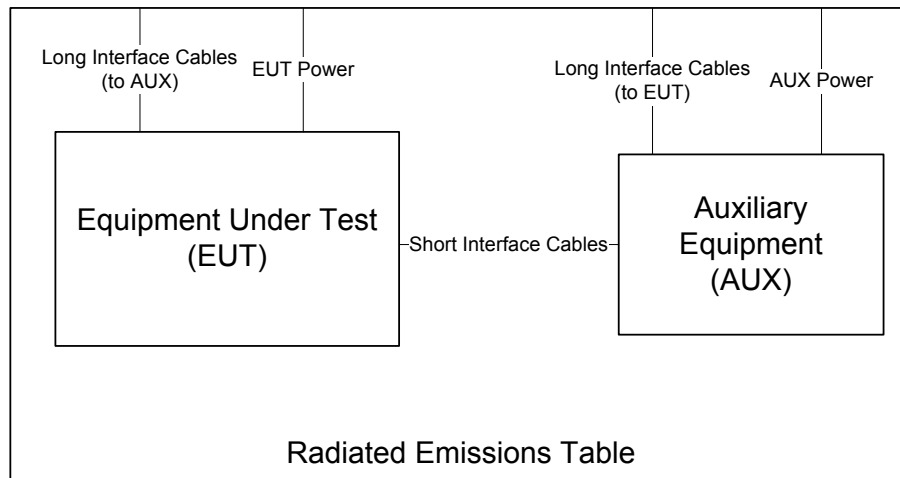

Figure 3: Radiated Emissions Diagram of the EUT.

intentionally radiating elements are placed on the test table lying flat, on their side, and on their end (3-axes) and the resulting worst case emissions are recorded. For both horizontal and vertical polarizations, the test antenna is raised and lowered from 1 to 4 m in height until a maximum emission level is detected. The EUT is then rotated through 360° in azimuth until the highest emission is detected. The test antenna is then raised and lowered one last time from 1 to 4 m and the worst case value is recorded. Photographs of the test setup employed are depicted in Figure 4.

If the EUT exhibits spurious emissions due to internal receiver circuitry, such emissions are measured with an appropriate carrier signal applied. For devices with intentional emissions below 30 MHz, a shielded loop antenna is used as the test antenna. It is placed at a 1 meter receive height and appropriate low frequency magnetic field extrapolation to the regulatory limit distance is employed. Emissions between 30 MHz and 1 GHz are measured using tuned dipoles and/or calibrated broadband antennas. Emissions above 1 GHz are characterized using standard gain horn antennas or calibrated broadband ridge-horn antennas. Care is taken to ensure that test receiver resolution and video bandwidths meet the regulatory requirements, and that the emission bandwidth of the EUT is not reduced.

Where regulations allow for direct measurement of field strength, power values (dBm) measured on the test receiver / analyzer are converted to dBμV/m at the regulatory distance, using

$$E_{dist} = 107 + P_R + K_A - K_G + K_E - C_F$$

where  $P_R$  is the power recorded on spectrum analyzer, in dBm,  $K_A$  is the test antenna factor in dB/m,  $K_G$  is the combined pre-amplifier gain and cable loss in dB,  $K_E$  is duty correction factor (when applicable) in dB, and  $C_F$  is a distance conversion (employed only if limits are specified at alternate distance) in dB. This field strength value is then compared with the regulatory limit. If effective isotropic radiated power (EIRP) is compute, it is computed as

$$EIRP(dBm) = E_{3m}(dB\mu V/m) - 95.2.$$

When presenting data at each frequency, the highest measured emission under all possible EUT orientations (3-axes) is reported.

Figure 4: Radiated Emissions Test Setup Photograph(s).

### 3.1.2 Conducted Emissions Test Setup and Procedures

**Battery Power Conducted Spurious** The EUT is not subject to measurement of power line conducted emissions as it is powered solely by its internal battery.

### 3.1.3 Power Supply Variation

Tests at extreme supply voltages are made if required by the the procedures specified in the test standard, and results of this testing are detailed in this report.

In the case the EUT is designed for operation from a lead-acid battery power source, the extreme test voltages are evaluated between 90% and 130% of the nominal battery voltage declared by the manufacturer. For float charge applications using gel-cell type batteries, extreme test voltages are evaluated between 85% and 115% of the nominal battery voltage declared. For all battery operated equipment, worst case intentional and spurious emissions are re-checked employing a new (fully charged) battery.

### 3.2 Intentional Emissions

#### 3.2.1 Fundamental Emission Pulsed Operation

The details and results of testing the EUT for pulsed operation are summarized in Table 3. Plots showing the measurements made to obtain these values are provided in Figure 5.

Table 3: Pulsed Emission Characteristics (Duty Cycle).

When the transmitter is activated (either by encoded manual LF activation or when periodically transmitting due to tire rotation), it can, in the worst case, transmit 4 frames of ASK data, only two of which may occur within any given 100 ms window. Each frame is 15.027 ms in length, containing two wake pulses (1 x 0.225 ms + 1 x 0.525 ms) followed by 14.027 ms of Manchester encoded data with a 0.105 ms /0.200 ms duty cycle. See the following Figure. Computing the duty factor results in:

<b>Duty Cycle Computation</b>		TRW TPMS; FCC/IC
1	$KE = *2 \times (0.225\text{ms} + 0.525 \text{ ms} + 14.025 * 0.105 \text{ ms} / 0.200 \text{ ms} ) / 100 \text{ ms} = 0.162 \text{ or } -15.8 \text{ dB}$	
2		

Meas. U of Mich.; 8/27/2013

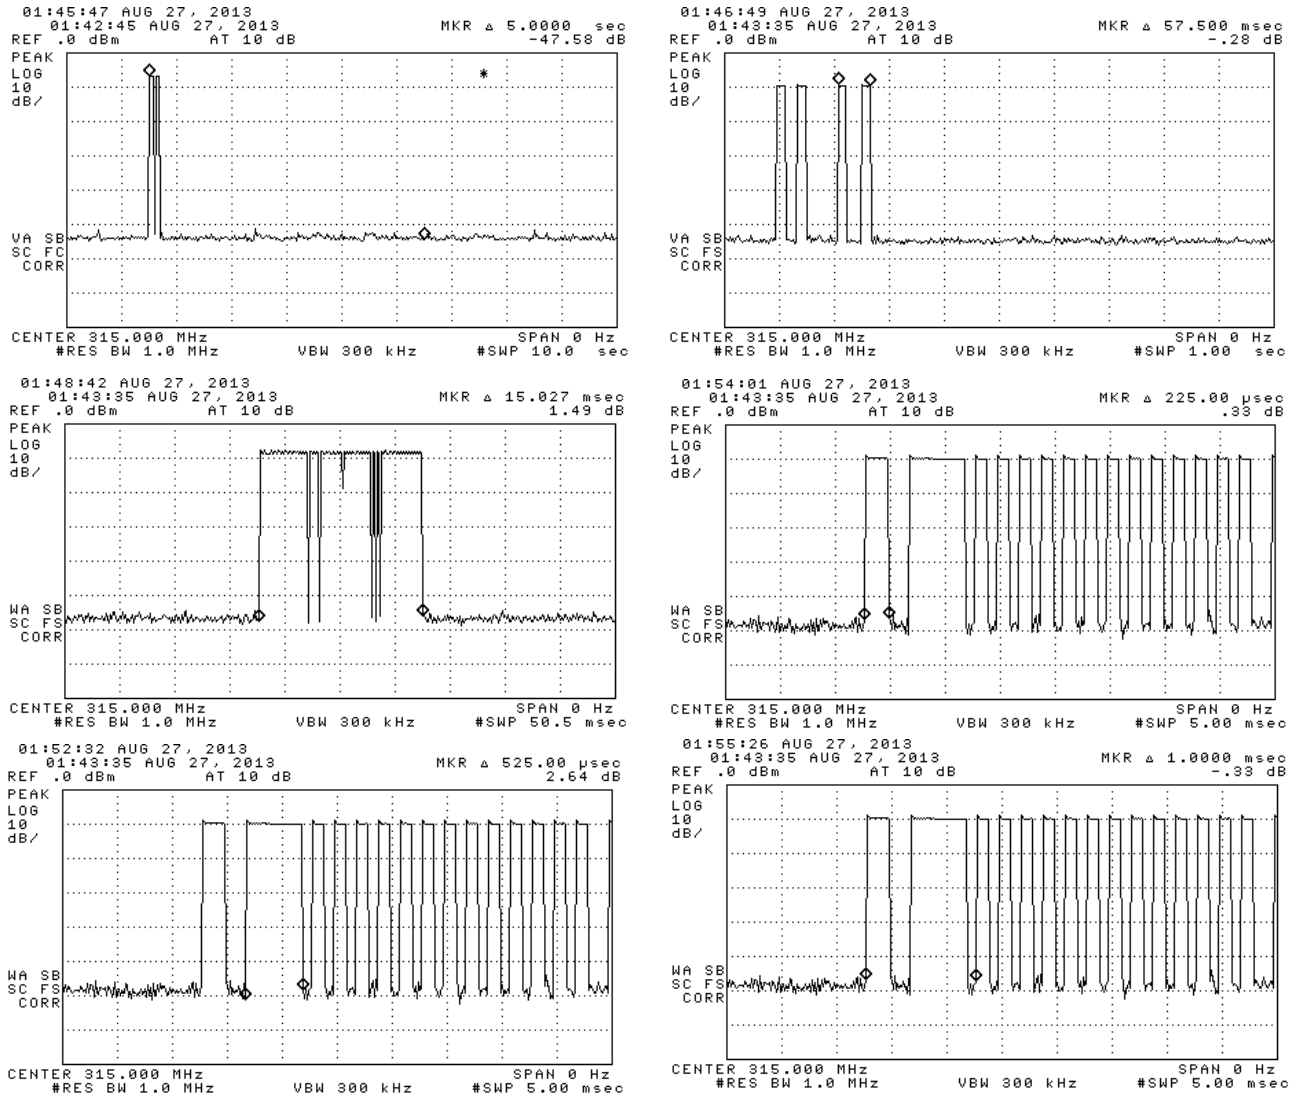

Figure 5(a): Pulsed Emission Characteristics (Duty Cycle).

Figure 5(b): Pulsed Emission Characteristics (Duty Cycle).

### 3.2.2 Fundamental Emission Bandwidth

Emission bandwidth (EBW) of the EUT is measured with the device placed in the test mode(s) with the shortest available frame length and minimum frame spacing. Radiated emissions are recorded following the test procedures listed in Section 1.1. The 20 dB EBW is measured as the max-held peak-detected signal when the IF bandwidth is greater than or equal to 1% of the receiver span. For complex modulations other than ASK and FSK, the 99% emission bandwidth per IC test procedures has a different result, and is also separately reported. The results of EBW testing are summarized in Table 4. Plots showing measurements employed to obtain the emission bandwidth reported are provided in Figure 6.

Table 4: Intentional Emission Bandwidth.

The emission bandwidth of the signal is shown in the following Figure. The allowed 99% bandwidth is 0.25% of 315 MHz, or 787.25 kHz.

Measured Emission Bandwidth				TRW TPMS; FCC/IC			
#	EBW meas. (kHz)						
1	58.0						

Meas. U of Mich.; 8/27/2013

Figure 6: Intentional Emission Bandwidth.

### 3.2.3 Fundamental Emission

Following the test procedures listed in Section 1.1, radiated emissions measurements are made on the EUT for both Horizontal and Vertical polarized fields. Table 5 details the results of these measurements.

Table 5: Fundamental Radiated Emissions.

Fundamental Radiated Emission											TRW, GQ4-67T; FCC/IC

### 3.3 Unintentional Emissions

#### 3.3.1 Transmit Chain Spurious Emissions

The results for the measurement of transmit chain spurious emissions at the nominal voltage and temperature are provided in Table 6. Measurements are performed to 10 times the highest fundamental operating frequency.

Table 6: Transmit Chain Spurious Emissions.
