GENERAL INFORMATION

- 1 APPLICANT : SILITEK CORPORATION.
- 2 ADDRESS : 10F, 25, SEC. 1, TUNG HWA S. RD.,
TAIPEI, TAIWAN, R. O. C.
- 3 MANUFACTURER : SILITEK CORPORATION.
- 4 ADDRESS : 10F, 25, SEC. 1, TUNG HWA S. RD.,
TAIPEI, TAIWAN, R. O. C.
- 5 DESCRIPTION OF EUT :
- EUT : Computer Keyboard
- FCC ID : GYUR59SK
- Model Number : SK-720H
- Serial # : N/A
- Data Cable : SHIELDED
- Power Cord : N/A
- Power Supply Type : N/A

6 FEATURES OF EUT :

- 6.1 PC/AT, PS/2 This keyboard is designed to be AT,PS/2 mode Mode Selection selection is done by auto-switchable.
- 6.2 Mode There are three LEDs on the keyboard to indicate Indicators 'Caps Lock', 'Num Lock' and 'Scroll Lock'.
The LEDs are 'toggled'. The first depression of the key turns on the LED.
The second depression turns the LED off and so on. LEDs are off on power-up or software reset, but will flash during power-on initialization.
- 6.3 Type Ahead The keyboard has 16 keys type ahead capability. This means that you can depress 16 keys before host can receive. If more keys are pressed before the host allows keyboard output, the additional data is lost.
- 6.4 Typematic With the exception of the Pause key, all keys are Delay and typematic.
When a key is pressed and held down, the Repeat keyboard delays 0.5 sec. and begins sending a make Rate Code for that key at a rate of 10.9 characters per second. (The delay is called typematic Delay and the rate is called Repeat Rate.)

If two or more keys are pressed, only the last key pressed is repeated at the repeat rate. Typematic operation stops only when the last key pressed is released, even if other keys are still held down. If a key is pressed and held down while keyboard transmission is disable, only the first make code is stored in the type ahead buffer. This prevents the type ahead buffer overflow as result of typematic action.

In AT mode, the typematic delay and repeat rate are programmable, this is done by command from host.

The default data:

Typematic Delay = 0.5 sec.

Repeat Rate = 10.9 characters per sec.

- 6.5 Pseudo The 'N' key roll-over capability where 'N' is the total N key number of keys on the keyboard 'N' key roll is the Roll-over

number of keys that may be held depressed simultaneously capability and have the keyboard generate the appropriate code for each pressed and released key without keyboard interruption.

6.6 Diagnostic

The keyboard microprocessor will perform a diagnostic test self-test after Power-up or after the host system signals the keyboard to perform a software Reset.

The microprocessor will check its data memory locations, do a sum-check internal RAM check and check for any depressed keys.

If the diagnostic test is correct, the keyboard will transmit an 'AA HEX' code.

This will be the first transmission following a Power-Up condition.

If the diagnostic test was unsuccessful, then the keyboard will transmit an 'FD/FC HEX' code. In either case, after the diagnostic check the keyboard will begin normal operation.
