# Dosimetric Assessment Test Report

for the

# DTC Communications

#### Tested and Evaluated In Accordance With FCC OET 65 Supplement C: 01-01

Prepared for

DTC Communications 486 Amherst Street Nashua, NH 03062

**Engineering Statement:** The measurements shown in this report were made in accordance with the procedures specified in Supplement C to OET Bulletin 65 of the Federal Communications Commission (FCC) Guidelines [FCC 2001] and Industry Canada RSS-102 for uncontrolled exposure. I assume full responsibility for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them. It is further stated that upon the basis of the measurements made, the equipment evaluated is capable of compliance for localized specific absorption rate (SAR) for uncontrolled environment/general population exposure limits specified in ANSI/IEEE Std. C95.1-1999.

#### INTRODUCTION

This measurement report demonstrates that the Palladium II 100 mW Video Transmitter Mod. # PD2-TX-100-S described within this report complies with the Specific Absorption Rate (SAR) RF exposure requirements specified in ANSI/IEEE Std. C95.1-1999 and FCC 47 CFR §2.1093 for the Uncontrolled Exposure/General population environment. The test procedures described in FCC OET Bulletin 65, Supplement C, Edition 01-01 were employed.

A description of the device under test, device operating configuration and test conditions, measurement and site description, methodology and procedures used in the evaluation, equipment used, detailed summary of the test results and the various provisions of the rules are included in this dosimetric assessment test report.

#### SAR DEFINITION

Specific Absorption Rate (SAR) is defined as the time derivative (rate) of the incremental energy (dU) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dV) of a given density ( $\rho$ ). It is also defined as the rate of RF energy absorption per unit mass at a point in an absorbing body (see Fig. 1.1).

$$SAR = \frac{d}{dt}(\frac{dU}{dm}) = \frac{d}{dt}(\frac{dU}{\rho dv})$$

#### Figure 1.1 SAR Mathematical Equation

SAR is expressed in units of Watts per Kilogram (W/kg).

$$SAR = \sigma E^2 / \rho$$

where:

 $\sigma$  - conductivity of the tissue - simulant material (S/m)

 $\rho$  - mass density of the tissue - simulant material (kg/m3)

E - Total RMS electric field strength (V/m)

NOTE: The primary factors that control rate of energy absorption were found to be the wavelength of the incident field in relations to the dimensions and geometry of the irradiated organism, the orientation of the organism in relation to the polarity of field vectors, the presence of reflecting surfaces, and whether conductive contact is made by the organism with a ground plane.

#### SAR MEASUREMENT SYSTEM

MET Laboratories, Inc SAR measurement facility utilizes the DASY4 Professional Dosimetric Assessment System (DASY<sup>TM</sup>) manufactured by Schmid & Partner Engineering AG (SPEAG<sup>TM</sup>) of Zurich, Switzerland for performing SAR compliance tests. The DASY4 measurement system is comprised of the measurement server, robot controller, computer, near-field probe, probe alignment sensor, specific anthropomorphic mannequin (SAM) phantom, and various planar phantoms for brain and/or body SAR evaluations. The robot is a six-axis industrial robot performing precise movements to position the probe to the location (points) of maximum electromagnetic field (EMF). The Cell controller system contain the power supply, robot controller, teach pendant (Joystick), and remote control, is used to drive the robot motors. The Staubli robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) circuit performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. is connected to

the Electro-optical coupler (EOC). The EOC performs the conversion from the optical into digital electric signal of the DAE and transfers data to the DASY4 measurement server. The DAE4 utilizes a highly sensitive electrometergrade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16-bit AD-converter and a command decoder and control logic unit.

Transmission to the DASY4 measurement server is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe-mounting device includes two different sensor systems for frontal and sidewise probe contacts. The sensor systems are also used for mechanical surface detection and probe collision detection. The robot uses its own controller with a built in VME-bus computer.

## **DETAILS OF SAR EVALUATION**

The DTC Communication's Palladium II 100 mW Video Transmitter was determined to be compliant for localized Specific Absorption Rate based on the test provisions and conditions described below.

- 1. The EUT was tested for body SAR.
- 2. The EUT was placed into a test mode using DTC's protocol software.
- 3. The SAR evaluations were performed with the EUT powered by 12VDC Power Supply
- 4. The dielectric parameters of the simulated body fluid were measured prior to the evaluation using an 85070D Dielectric Probe Kit and an 8722D Network Analyzer.
- 5. The fluid and air temperature was measured prior to and after each SAR evaluation to ensure the temperature remained within  $\pm 2 \text{ deg C}$  of the temperature of the fluid when the dielectric properties were measured.
- 6. During the SAR evaluations if a distribution produced several hotspots over the course of the area scan, each hotspot was evaluated separately.

#### FLOW CHART OF THE RECOMMENDED PRACTICES AND PROCEDURES

#### **EAR Reference Point**

Figure 12.1 shows the front, back and side views of the SAM Twin Phantom. The point M is the reference point for the center of the mouth, LE is the left ear reference point (ERP), and RE is the right ERP. The ERPs are 15mm posterior to the entrance to the ear canal (EEC) along the B-M line (Back-Mouth), as shown in Figure 12.2. The plane passing through the two ear canals and M is defined as the Reference Plane. The line N-F (Neck-Front) is perpendicular to the reference plane and passing through the RE (or LE) is called the Reference Pivoting. Line B-M is perpendicular to the N-F line. Both N-F and B-M lines are marked on the external phantom shell to facilitate handset positioning.

Front, back and side view of SAM Twin Phantom

Side view of ERPs

#### HANDSET REFERENCE POINTS

Two imaginary lines on the handset were established: the vertical centerline and the horizontal line. The test device was placed in a normal operating position with the test device reference point located along the vertical centerline on the front of the device aligned to the ear reference point (See Fig. 12.3). The test device reference point was than located at the same level as the center of the ear reference point. The test device was positioned so that the vertical centerline was bisecting the front surface of the handset at it s top and bottom edges, positioning the ear reference point on the outer surface of the both the left and right head phantoms on the ear reference point.

Figure 12.3 Handset Vertical Center & Horizontal Line Reference Points

#### **POSITIONING FOR CHEEK/TOUCH**

1. The test device was positioned with the handset close to the surface of the phantom such that point A is on the (virtual) extension of the line passing through points RE and LE on the phantom, such that the plane defined by the vertical center line and the horizontal line of the phone is approximately parallel to the sagittal plane of the phantom.

2. The handset was translated towards the phantom along the line passing through RE & LE until the handset touches the ear.

3. While maintaining the handset in this plane, the handset was rotated around the LE-RE line until the vertical centerline was in the plane normal to MB-NF including the line MB (reference plane).

4. The phone was hen rotated around the vertical centerline until the phone (horizontal line) was symmetrical was respect to the line NF.

5. While maintaining the vertical centerline in the reference plane, keeping point A on the line passing through RE and LE, and maintaining the phone contact with the ear, the handset was rotated about the line NF until any point on the handset made contact with a phantom point below the ear (cheek). See Figure 12.5)

Front, Side and Top View of Cheek/Touch Position

Side view with relevant markings

#### **POSITIONING FOR EAR/15 DEGREE TILE**

With the test device aligned in the Cheek/Touch Position:

1. While maintaining the orientation of the phone, the phone was retracted parallel to the reference plane far enough to enable a rotation of the phone by 15 degree.

2. The phone was then rotated around the horizontal line by 15 degree.

3. While maintaining the orientation of the phone, the phone was moved parallel to the reference plane until any part of the phone touches the head. (In this position, point A was located on the line RE-LE). The tilted position is obtained when the contact is on the pinna. If the contact was at any location other than the pinna, the angle of the phone would then be reduced. The tilted position was obtained when any part of the phone was in contact of the ear as well as a second part of the phone was in contact with the head.

Front, Side and Top View of Ear/15 Tilt Position

#### **EVALUATION PROCEDURES**

The evaluation was performed in the applicable area of the phantom depending on the type of device being tested.

- (i) For devices held to the ear during normal operation, both the left and right ear positions were evaluated using the SAM phantom.
- (ii) For body-worn and face-held devices a planar phantom was used.

The SAR was determined by a pre-defined procedure within the DASY4 software. Upon completion of a reference check, the exposed region of the phantom was scanned near the inner surface with a grid spacing of 15mm x 15mm.

An area scan was determined as follows:

Based on the defined area scan grid, a more detailed grid is created to increase the points by a factor of 10. The interpolation function then evaluates all field values between corresponding measurement points.

A linear search is applied to find all the candidate maxima. Subsequently, all maxima are removed that are >2 dB from the global maximum. The remaining maxima are then used to position the cube scans.

A 1g and 10g spatial peak SAR was determined as follows:

For frequencies  $\leq 4.5$ GHz a 32mm x 32mm x 34mm (7x7x7 data points) zoom scan was assessed at the position where the greatest V/m was detected. For frequencies  $\geq 4.5$ GHz a 28mm x 28mm x 24mm (7x7x9 data points) zoom scan was assessed at the position where the greatest V/m was detected. The data at the surface was extrapolated since the distance from the probes sensors to the surface is 3.9cm. A least squares fourth-order polynomial was used to generate points between the probe detector and the inner surface of the phantom.

Interpolated data is used to calculate the average SAR over 1g and 10g cubes by spatially discretizing the entire measured cube. The volume used to determine the averaged SAR is a 1mm grid (42875 interpolated points).

Z-Scan was determined as follows:

The Z-scan measures points along a vertical straight line. The line runs along a line normal to the inner surface of the phantom surface.

#### **DATA EVALUATION PROCEDURES**

The DASY4 post processing software (SEMCAD) automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software:

| Probe Parameters:  | <ul><li>Sensitivity</li><li>Conversion Factor</li><li>Dipole Compression Point</li></ul> | Norm <sub>i</sub> , $a_{i0}$ , $a_{i1}$ , $a_{i2}$<br>Conv $F_i$<br>$dcp_i$ |
|--------------------|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| Device parameters: | - Frequency<br>- Crest factor                                                            | f<br>cf                                                                     |
| Media parameters:  | - Conductivity<br>- Density                                                              | σ<br>ρ                                                                      |

These parameters must be set correctly in the software. They can be found in the component documents or can be imported into the software from the configuration files issued for the DASY components. In the direct measuring mode of the multimeter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used. The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC - transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as:

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$$

with $V_i$  = Compensated signal of channel i (i = x, y, z) $U_i$  = Input signal of channel i (i = x, y, z)cf = Crest factor of exciting field (DASY parameter) $dcp_i$  = Diode compression point (DASY parameter)

From the compensated input signals the primary field data for each channel can be evaluated:

$$\begin{split} \mathrm{E-field probes}: \qquad & E_i = \sqrt{\frac{V_1}{Norm_i \cdot ConvF}} \\ \mathrm{H-field probes}: \qquad & H_i = \sqrt{V_i} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{f} \\ \text{with } V_i = \mathrm{Compensated \ signal \ of \ channel \ i} \qquad & (\mathrm{i} = \mathrm{x}, \mathrm{y}, \mathrm{z}) \\ Norm_i = \mathrm{Sensor \ sensitivity \ of \ channel \ i} \qquad & (\mathrm{i} = \mathrm{x}, \mathrm{y}, \mathrm{z}) \\ \mu \mathrm{V}/(\mathrm{V/m})^2 \ \mathrm{for \ E-field \ probes} \\ ConvF = \mathrm{Sensitivity \ enhancement \ in \ solution} \\ a_{ij} = \mathrm{Sensor \ sensitivity \ factors \ for \ H-field \ probes} \\ f = \mathrm{Carrier \ frequency \ (GHz)} \\ E_i = \mathrm{Electric \ field \ strength \ of \ channel \ i \ in \ V/m} \\ H_i = \mathrm{Magnetic \ field \ strength \ of \ channel \ i \ in \ A/m} \end{split}$$

The RSS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1'000}$$

with SAR = local specific absorption rate in mW/g

 $E_{tot}$  = total field strength in V/m

 $\sigma$  = conductivity in [mho/m] or [Siemens/m]

 $\rho$  = equivalent tissue density in g/cm3

Note that the density is normally set to 1 (or 1.06), to account for actual brain density rather than the density of the simulation liquid.

The power flow density is calculated assuming the excitation field as a free space field.

$$P_{pwe} = \frac{E_{tot}^2}{3770} \qquad \text{or} \qquad P_{pwe} = H_{tot}^2 \cdot 37.7$$

with  $P_{pwe}$  = Equivalent power density of a plane wave in mW/cm2  $E_{tot}$  = total electric field strength in V/m  $H_{tot}$  = total magnetic field strength in A/m

### SYSTEM PERFORMANCE CHECK

Prior to the SAR evaluation a system check was performed in the planar section of the SAM phantom with a 2450MHz dipole. The dielectric parameters of the simulated fluid were measured prior to the system performance check using an 85070D Dielectric Probe Kit and an 8722D Network Analyzer. A forward power of 250mW was applied to the dipole and the system was verified to a tolerance of +10%. All results were normalized to 1W.

|           | Fluid Type |                          | R 1g<br>/kg) | Permit<br>Consta | •            | Conductivity   | σ (mho/m) | Ambien         | Fluid<br>Temp | Fluid         |
|-----------|------------|--------------------------|--------------|------------------|--------------|----------------|-----------|----------------|---------------|---------------|
| Test Date | (MHz)      | Calibrat<br>ed<br>Target | Measure<br>d | IEEE<br>Target   | Measur<br>ed | IEEE<br>Target | Measured  | t Temp.<br>(C) | ·<br>(C)      | Depth<br>(cm) |

#### **SAR Measurement System**

Measurement System Diagram

#### 1.4. <u>RX90BL ROBOT</u>

The Stäubli RX90BL Robot is a standard high precision 6-axis robot with an arm extension for accommodating the data acquisition electronics (DAE).

#### 1.5. <u>ROBOT CONTROLLER</u>

The CS7MB Robot Controller system drives the robot motors. The system consists of a power supply, robot controller, and remote control with teach pendant and additional circuitry for robot safety such as warning lamps, etc.

#### 1.6. LIGHT BEAM SWITCH

The Light Beam Switch (Probe alignment tool) allows automatic "tooling" of the probe. During the process, the actual position of the probe tip with respect to the robot arm is measured as well as the probe length and the horizontal probe offset. The software then corrects all movements, so that the robot coordinates are valid for the probe tip. The repeatability of this process is better than 0.1 mm. If a position has been taught with an aligned probe, the same position will be reached with another aligned probe within 0.1 mm, even if the other probe has different dimensions. During probe rotations, the probe tip will keep its actual position.

#### 1.7. DATA ACQUISITION ELECTRONICS

The Data Acquisition Electronics consists of a highly sensitive electrometer grade preamplifier with auto-zeroing, a channel and gain switching multiplexer, a fast 16-bit A/D converter and a command decoder and control logic unit. Some of the task the DAE performs is signal amplification, signal multiplexing, A/D conversion, and offset measurements. The DAE also contains the mechanical probe-mounting device, which contains two different sensor systems for frontal and sideways probe contacts used for probe collision detection and mechanical surface detection for controlling the distance between the probe and the inner surface of the phantom shell. Transmission from the DAE to the measurement server, via the EOC, is through

an optical downlink for data and status information as well as an optical uplink for commands and the clock.

evaluation of left hand, right hand phone usage as well as body mounted usage at the flat phantom region. The flat section is also used for system validation and the length and width of the flat section are at least 0.75  $\lambda$ O and 0.6  $\lambda$ O respectively at frequencies of 824 MHz and above ( $\lambda O$  = wavelength in air).

Reference markings on the phantom top allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot. A white cover is provided to cover the phantom during off-periods preventing water evaporation and changes in the liquid parameters. Free space scans of devices on the cover are possible. The phantom is filled with a tissue simulating liquid to a depth of at least 15 cm at each ear reference point. The bottom plate of the wooden table contains three pair of bolts for locking the device holder.

#### PLANAR PHANTOM 1.12.

The planar phantom is constructed of Plexiglas material with a 2.0 mm shell thickness for face-held and body-worn SAR evaluations of handheld radio transceivers. The planar phantom is mounted on the wooden table of the DASY4 system.

**MEASUREMENT SERVER** 

**ELECTO-OPTICAL CONVERTER (EOC)** 

The Electro-Optical Converter performs the conversion between the optical and electrical of the signals for the digital communication to the DAE and for the analog signal from the optical surface detection. The EOC connects to, and transfers data to, the DASY4 measurement server. The EOC also contains the fiber optical surface detection system for controlling the distance between the probe and the inner surface of the phantom shell.

The Measurement Server performs time critical tasks such as signal filtering, all real-time data evaluation for field measurements and surface detection, controls

robot movements, and handles safety operation. The PC-operating system cannot interfere with these time critical processes. A watchdog supervises all connections, and disconnection of any of the cables to the measurement server will automatically

disarm the robot and disable all program-controlled robot movements.

Dosimetric Probe is a symmetrical design with triangular core that incorporates three 3 mm long

#### 1.10. **DOSIMETRIC PROBE**

dipoles arranged so that the overall response is close to isotropic. The probe sensors are covered by an outer protective shell, which is resistant to organic solvents i.e. glycol. The probe is equipped with an optical multi-fiber line, ending at the front of the probe tip, for optical surface detection. This line connects to the EOC box on the robot arm and provides automatic detection of the phantom surface. The optical surface detection works in transparent liquids and on diffuse reflecting surfaces with a repeatability of better than  $\pm 0.1$  mm.

**SAM PHANTOM** 

thickness (except the ear region where shell thickness increases to 6mm) integrated into a wooden table. The shape of the shell corresponds to the phantom defined by SCC34-SC2. It enables the dosimetric

1.11.

#### 1.13. VALIDATION PLANAR PHANTOM

The validation planar phantom is constructed of Plexiglas material with a 6.0 mm shell thickness for system validations at 450MHz and below. The validation planar phantom is mounted on the wooden table of the DASY4 system.

#### 1.14. <u>DEVICE HOLDER</u>

The device holder is designed to cope with the different measurement positions in the three sections of the SAM phantom given in the standard. It has two scales, one for device rotation (with respect to the body axis) and one for device inclination (with respect to the line between the ear openings). The rotation center for both scales is the ear opening, thus the device needs no repositioning when changing the angles. The plane between the ear openings and the mouth tip has a rotation angle of  $65^{\circ}$ .

The DASY device holder has been made out of low-loss POM material having the following dielectric parameters: relative permittivity  $\varepsilon = 3$  and loss tangent  $\delta = 0.02$ . The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

The dielectric properties of the liquid conform to all the tabulated values [2-5]. Liquids are prepared according to Annex A and dielectric properties are measured according to Annex B.

#### 1.15. SYSTEM VALIDATION KITS

Power Capability: > 100 W (f < 1 GHz); > 40 W (f > 1 GHz)

Construction: Symmetrical dipole with 1/4 balun Enables measurement of feed point impedance with NWA Matched for use near flat phantoms filled with brain simulating solutions Includes distance holder and tripod adaptor.

Frequency: 300, 450, 835, 1900, 2450 MHz, 5-6GHz

Return loss: >20 dB at specified validation position

Dimensions: 300 MHz Dipole: Length: 396mm; Overall Height: 430 mm; Diameter: 6 mm
450 MHz Dipole: Length: 270 mm; Overall Height: 347 mm; Diameter: 6 mm
835 MHz Dipole: Length: 161 mm; Overall Height: 270 mm; Diameter: 3.6 mm
1900 MHz Dipole: Length: 68 mm; Overall Height: 219 mm; Diameter: 3.6 mm
2450 MHz Dipole: Length: 51.5 mm; Overall Height: 300 mm; Diameter: 3.6 mm
5-6GHz Dipole: Length: 26.0 mm; Overall Height: 170 mm; Diameter: 3.6 mm

## **APPENDIX A - SAR MEASUREMENT DATA**

## 2451MHz 1.25MHz Bandwidth Body

Date/Time: 3/2/2009 1:25:32 PM

#### DUT: DTC; Type: PD2-TX-100-S

Medium Notes: ambitent temp: 22.5 deg C, Fluid Temp 22.0 deg C.

Communication System: DTS ; ; Frequency: 2451 MHz;Duty Cycle: 1:1 Medium: M2437 Medium parameters used (interpolated): f = 2451 MHz;  $\sigma = 1.93$  mho/m;  $\varepsilon_r = 52.5$ ;  $\rho = 1000$  kg/m<sup>3</sup> Phantom section: Flat Section

- Probe: EX3DV3 - SN3511; ConvF(7.89, 7.89, 7.89); Calibrated: 5/16/2008

- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn584; Calibrated: 4/2/2007
- Phantom: SAM with CRP; Type: SAM; Serial: TP 1310
- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

#### Area Scan (101x201x1): Measurement grid: dx=10mm, dy=10mm

Maximum value of SAR (interpolated) = 0.100 mW/g

**Zoom Scan (7x7x11)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=3mm Reference Value = 5.81 V/m; Power Drift = 0.204 dB Peak SAR (extrapolated) = 0.137 W/kg **SAR(1 g) = 0.077 mW/g; SAR(10 g) = 0.045 mW/g Maximum value of SAR (measured) = 0.094 mW/g** 

## 2466MHz 1.25MHz Bandwidth Body

Date/Time: 3/2/2009 2:19:46 PM

#### DUT: DTC; Type: PD2-TX-100-S

Medium Notes: ambitent temp: 22.5 deg C, Fluid Temp 22.0 deg C.

Communication System: DTS ; ; Frequency: 2466 MHz;Duty Cycle: 1:1 Medium: M2437 Medium parameters used (interpolated): f = 2466 MHz;  $\sigma = 1.95$  mho/m;  $\epsilon_r = 52.4$ ;  $\rho = 1000$  kg/m<sup>3</sup> Phantom section: Flat Section

- Probe: EX3DV3 - SN3511; ConvF(7.89, 7.89, 7.89); Calibrated: 5/16/2008

- Sensor-Surface: 3mm (Mechanical Surface Detection)

- Electronics: DAE3 Sn584; Calibrated: 4/2/2007

- Phantom: SAM with CRP; Type: SAM; Serial: TP 1310

- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

Area Scan (101x201x1): Measurement grid: dx=10mm, dy=10mmMaximum value of SAR (interpolated) = 0.100 mW/g

**Zoom Scan (7x7x11)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=3mm Reference Value = 6.18 V/m; Power Drift = -0.104 dB Peak SAR (extrapolated) = 0.146 W/kg **SAR(1 g) = 0.080 mW/g; SAR(10 g) = 0.046 mW/g Maximum value of SAR (measured) = 0.098 mW/g** 

## 2482.5MHz 1.25MHz Bandwidth Body

Date/Time: 3/2/2009 2:55:47 PM

#### DUT: DTC; Type: PD2-TX-100-S

Medium Notes: ambitent temp: 22.5 deg C, Fluid Temp 22.0 deg C.

Communication System: DTS ; ; Frequency: 2482.5 MHz;Duty Cycle: 1:1 Medium: M2437 Medium parameters used (interpolated): f = 2482.5 MHz;  $\sigma = 1.96$  mho/m;  $\varepsilon_r = 52.4$ ;  $\rho = 1000$  kg/m<sup>3</sup> Phantom section: Flat Section

- Probe: EX3DV3 - SN3511; ConvF(7.89, 7.89, 7.89); Calibrated: 5/16/2008

- Sensor-Surface: 3mm (Mechanical Surface Detection)

- Electronics: DAE3 Sn584; Calibrated: 4/2/2007

- Phantom: SAM with CRP; Type: SAM; Serial: TP 1310

- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

Area Scan (101x201x1): Measurement grid: dx=10mm, dy=10mmMaximum value of SAR (interpolated) = 0.091 mW/g

**Zoom Scan (7x7x11)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=3mm Reference Value = 5.73 V/m; Power Drift = -0.001 dB Peak SAR (extrapolated) = 0.133 W/kg **SAR(1 g) = 0.073 mW/g; SAR(10 g) = 0.042 mW/g Maximum value of SAR (measured) = 0.090 mW/g** 

## 2454MHz 8MHz Bandwidth Body

Date/Time: 3/2/2009 3:28:46 PM

#### DUT: DTC; Type: PD2-TX-100-S

Medium Notes: ambitent temp: 22.5 deg C, Fluid Temp 22.0 deg C.

Communication System: DTS ; ; Frequency: 2454 MHz;Duty Cycle: 1:1 Medium: M2437 Medium parameters used (interpolated): f = 2454 MHz;  $\sigma = 1.93$  mho/m;  $\epsilon_r = 52.5$ ;  $\rho = 1000$  kg/m<sup>3</sup> Phantom section: Flat Section

- Probe: EX3DV3 - SN3511; ConvF(7.89, 7.89, 7.89); Calibrated: 5/16/2008

- Sensor-Surface: 3mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn584; Calibrated: 4/2/2007
- Phantom: SAM with CRP; Type: SAM; Serial: TP 1310
- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

**Area Scan (101x201x1):** Measurement grid: dx=10mm, dy=10mm Maximum value of SAR (interpolated) = 0.099 mW/g

**Zoom Scan (7x7x11)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=3mm Reference Value = 5.96 V/m; Power Drift = 0.068 dB Peak SAR (extrapolated) = 0.140 W/kg **SAR(1 g) = 0.079 mW/g; SAR(10 g) = 0.046 mW/g Maximum value of SAR (measured) = 0.096 mW/g** 

## 2466MHz 8MHz Bandwidth Body

Date/Time: 3/2/2009 4:22:44 PM

#### DUT: DTC; Type: PD2-TX-100-S

Medium Notes: ambitent temp: 22.5 deg C, Fluid Temp 22.0 deg C.

Communication System: DTS ; ; Frequency: 2466 MHz;Duty Cycle: 1:1 Medium: M2437 Medium parameters used (interpolated): f = 2466 MHz;  $\sigma = 1.95$  mho/m;  $\varepsilon_r = 52.4$ ;  $\rho = 1000$  kg/m<sup>3</sup> Phantom section: Flat Section

- Probe: EX3DV3 - SN3511; ConvF(7.89, 7.89, 7.89); Calibrated: 5/16/2008

- Sensor-Surface: 3mm (Mechanical Surface Detection)

- Electronics: DAE3 Sn584; Calibrated: 4/2/2007

- Phantom: SAM with CRP; Type: SAM; Serial: TP 1310

- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

Area Scan (101x201x1): Measurement grid: dx=10mm, dy=10mmMaximum value of SAR (interpolated) = 0.097 mW/g

**Zoom Scan (7x7x11)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=3mm Reference Value = 6.06 V/m; Power Drift = -0.136 dB Peak SAR (extrapolated) = 0.141 W/kg **SAR(1 g) = 0.077 mW/g; SAR(10 g) = 0.045 mW/g Maximum value of SAR (measured) = 0.094 mW/g** 

## 2479.5MHz 8MHz Bandwidth Body

Date/Time: 3/2/2009 4:56:52 PM

#### DUT: DTC; Type: PD2-TX-100-S

Medium Notes: ambitent temp: 22.5 deg C, Fluid Temp 22.0 deg C.

Communication System: DTS ; ; Frequency: 2479.5 MHz;Duty Cycle: 1:1 Medium: M2437 Medium parameters used (interpolated): f = 2479.5 MHz;  $\sigma = 1.96$  mho/m;  $\varepsilon_r = 52.4$ ;  $\rho = 1000$  kg/m<sup>3</sup> Phantom section: Flat Section

- Probe: EX3DV3 - SN3511; ConvF(7.89, 7.89, 7.89); Calibrated: 5/16/2008

- Sensor-Surface: 3mm (Mechanical Surface Detection)

- Electronics: DAE3 Sn584; Calibrated: 4/2/2007

- Phantom: SAM with CRP; Type: SAM; Serial: TP 1310

- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

**Area Scan (101x201x1):** Measurement grid: dx=10mm, dy=10mm Maximum value of SAR (interpolated) = 0.093 mW/g

**Zoom Scan (7x7x11)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=3mm Reference Value = 5.88 V/m; Power Drift = 0.024 dB Peak SAR (extrapolated) = 0.137 W/kg **SAR(1 g) = 0.075 mW/g; SAR(10 g) = 0.043 mW/g Maximum value of SAR (measured) = 0.090 mW/g** 

#### **APPENDIX B - SYSTEM PERFORMANCE CHECK**

## 2450MHz Body Verification

Date/Time: 3/2/2009 9:16:25 AM

DUT: Dipole 2450 MHz; Type: 1S2452

Communication System: CW; ; Frequency: 2450 MHz;Duty Cycle: 1:1 Medium: M2450 Medium parameters used: f = 2450 MHz;  $\sigma = 1.93$  mho/m;  $\epsilon_r = 52.5$ ;  $\rho = 1000$  kg/m<sup>3</sup> Phantom section: Flat Section

- Probe: EX3DV3 - SN3511; ConvF(7.89, 7.89, 7.89); Calibrated: 5/16/2008

- Sensor-Surface: 4mm (Mechanical Surface Detection)

- Electronics: DAE3 Sn584; Calibrated: 4/2/2007

- Phantom: SAM with CRP; Type: SAM; Serial: TP 1310

- Measurement SW: DASY4, V4.7 Build 71; Postprocessing SW: SEMCAD, V1.8 Build 184

**Area Scan (61x81x1):** Measurement grid: dx=10mm, dy=10mm Maximum value of SAR (interpolated) = 16.9 mW/g

**Zoom Scan (7x7x7)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 91.1 V/m; Power Drift = -0.010 dB Peak SAR (extrapolated) = 28.7 W/kg **SAR(1 g) = 14 mW/g; SAR(10 g) = 6.4 mW/g** Maximum value of SAR (measured) = 16.0 mW/g

#### **APPENDIX C – PROBE CALIBRATION CERTIFICATE**

|                                                                                                                                                                                                                                                                                                                 | ch, Switzerland                                                                                                                                                                                                     | BCMEA (C C Z Z                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Servizio svizzero di taratura                                                                                                                            |

Calibration Laboratory of Schmid & Partner Engineering AG Zeughausstrasse 43, 8004 Zurich, Switzerland

- SWISS CP NO CP NO CP NO S ST
  - Schweizerischer Kalibrierdienst Service suisse d'étalonnage Servizio svizzero di taratura Swiss Calibration Service

Accreditation No.: SCS 108

Accredited by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

#### **Glossary:**

| TSL                 | tissue simulating liquid                                                                                                                           |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| NORMx,y,z           | sensitivity in free space                                                                                                                          |
| ConvF               | sensitivity in TSL / NORMx,y,z                                                                                                                     |
| DCP                 | diode compression point                                                                                                                            |
| Polarization $\phi$ | φ rotation around probe axis                                                                                                                       |
| Polarization 9      | $\vartheta$ rotation around an axis that is in the plane normal to probe axis (at measurement conter) i.e. $\vartheta = 0$ is normal to probe axis |
|                     | measurement center), i.e., $\vartheta = 0$ is normal to probe axis                                                                                 |

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003
- b) IEC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005

#### Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization 9 = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not effect the E<sup>2</sup>-field uncertainty inside TSL (see below *ConvF*).
- NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep (no uncertainty required). DCP does not depend on frequency nor media.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for f ≤ 800 MHz) and inside waveguide using analytical field distributions based on power measurements for f > 800 MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz.
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.

Certificate No: EX3-3511\_May08

#### Sensor Offset

Probe Tip to Sensor Center

1.0 mm

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

<sup>A</sup> The uncertainties of NormX,Y,Z do not affect the E<sup>2</sup>-field uncertainty inside TSL (see Page 8).

 $^{\rm B}$  Numerical linearization parameter: uncertainty not required.

| Calibration Procedure:            | Calibration procedure for a validation dipole |
| Calibration Date:                 | 1/13/09                                       |
| Condition of the Calibrated Item: | In Tolerance                                  |

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI). The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in a closed laboratory facility: environment temperature  $(22 \pm 3)$  °C and humidity < 70%

#### Calibration procedure for validation dipole

Calibration is performed according to the following standards:

- a) IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communication Devices: Measurement Techniques", December 2003
- b) CENELEC EN 50361, "Basic standard for the measurement of Specific Absorption Rate related to human exposure to electromagnetic fields from mobile phones (300MHz – 3GHz), July 2001
- c) Federal Communications Commission Office of Engineering & Technology (FCC OET), "Evaluating Compliance with FCC Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields; Additional information for Evaluating Compliance of Mobile and Portable Devices with FCC Limits for Human Exposure to Radiofrequency Emissions", Bulletin 65 Supplement C (Edition01-01).

Additional Documents

d) DASY4 System Handbook

Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All Figures stated in the certificate are valid at the frequency indicated.
- Antenna check: The antenna is checked for straightness using a straight edge placed parallel to the dipole arms prior to installing it against the phantom surface.
- The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Antenna flatness: The spacer thickness used for the 2450MHz dipole is 10.00mm +/- 0.2mm. To insure the antenna is within +/- 2 degrees of flatness to the phantom surface use a caliper to measure the dipole ends from the surface of the phantom.
- Vector Network Analyzer: The network analyzer is calibrated as per the user's manual.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. A Return Loss >20dB ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No Uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1W at the antenna connector. No Uncertainty required
- SAR for nominal head and muscle parameters: The measured TSL parameters are used to calculate the SAR results.

## **Head TSL Parameters**

The following parameters and calculations were applied

|                              | Temperature | Permittivity | Conductivity   |
|------------------------------|-------------|--------------|----------------|
| Nominal Head TSL Parameters  | 22.0 °C     | 39.2         | 1.88           |
| Measured Head TSL Parameters | 22.0 °C     | 39.2 ±5%     | $1.88 \pm 5\%$ |

## SAR results with Head TSL and system uncertainty

| SAR averaged over 1 cm <sup>3</sup> (1g) of Head TSL | Condition         | 15.7 mW/g                |
|------------------------------------------------------|-------------------|--------------------------|
| SAR Normalized                                       | Normalized to 1 W | 62.8 mW/g                |
| SAR for nominal Head TSL Parameters                  | Normalized to 1W  | 62.8 ± 24.29% mW/g (k=2) |

| SAR averaged over 1 cm <sup>3</sup> (10g) of Head TSL | Condition         | 7.08 mW/g                      |
|-------------------------------------------------------|-------------------|--------------------------------|
| SAR Normalized                                        | Normalized to 1 W | 28.32 mW/g                     |
| SAR for nominal Head TSL Parameters                   | Normalized to 1 W | $28.32 \pm 23.51\%$ mW/g (k=2) |

## **Muscle TSL Parameters**

The following parameters and calculations were applied

|                              | Temperature | Permittivity | Conductivity |
|------------------------------|-------------|--------------|--------------|
| Nominal Head TSL Parameters  | 22.0 °C     | 52.5         | 1.93         |
| Measured Head TSL Parameters | 22.0 °C     | 52.5 ±5%     | 1.93 ±5%     |

# SAR results with Muscle TSL and system uncertainty

| SAR averaged over 1 cm <sup>3</sup> (1g) of Head TSL | Condition         | 14 mW/g                  |
|------------------------------------------------------|-------------------|--------------------------|
| SAR Normalized                                       | Normalized to 1 W | 56.0 mW/g                |
| SAR for nominal Head TSL Parameters                  | Normalized to 1 W | 56.0 ± 24.29% mW/g (k=2) |

| SAR averaged over 1 cm <sup>3</sup> (10g) of Head TSL | Condition         | 6.4 mW/g                 |
|-------------------------------------------------------|-------------------|--------------------------|
| SAR Normalized                                        | Normalized to 1 W | 25.6 mW/g                |
| SAR for nominal Head TSL Parameters                   | Normalized to 1 W | 25.6 ± 23.51% mW/g (k=2) |

### 2450MHz Head

Date/Time: 1/13/2009 6:15:09 PM

DUT: Dipole 2450 MHz; Type: 1S2570

Communication System: CW; ; Frequency: 2450 MHz;Duty Cycle: 1:1 Medium: H2450 Medium parameters used:  $\sigma = 1.88$  mho/m,  $\varepsilon_r = 39.2$ ;  $\rho = 1000$  kg/m<sup>3</sup> Medium parameters used: f = 2450

MHz;  $\sigma = 1.88$  mho/m;  $\varepsilon_r = 39.2$ ;  $\rho = 1000$  kg/m<sup>3</sup> Phantom section: Flat Section

- Probe: EX3DV3 - SN3511; ConvF(7.67, 7.67, 7.67); Calibrated: 5/16/2008

- Sensor-Surface: 4mm (Mechanical Surface Detection)

#### Tests

The series production process used allows the limitation to test of first articles.

Complete tests were made on the pre-series Type No. QD 000 P40 AA, Serial No. TP-1001 and on the series first article Type No. QD 000 P40 BA, Serial No. TP-1006. Certain parameters have been retested using further series units (called samples).

| Shape                  | Compliance with the geometry according to the CAD model.                                                                                              | IT'IS CAD File (*)                                                   | First article,<br>Samples                |
| Material thickness     | Compliant with the requirements according to the standards                                                                                            | 2mm +/- 0.2mm in<br>specific areas;<br>6mm +/- 0.2mm at ERP          | First article,<br>Samples                |
| Material<br>parameters | Dielectric parameters for required frequencies                                                                                                        | 200 MHz – 3 GHz<br>Relative permittivity < 5<br>Loss tangent < 0.05. | Material<br>sample<br>TP 104-5           |
| Material resistivity   | The material has been tested to be<br>compatible with the liquids defined in<br>the standards if handled and cleaned<br>according to the instructions | DEGMBE based<br>simulating liquids                                   | Pre-series,<br>First article,<br>Samples |

#### Standards

- [1] CENELEC EN 50361
- [2] IEEE Std 1528-200x Draft CD 1.1 (Dec 02)
- [3] IEC 62209/CD (Nov 02)
- (\*) The IT'IS CAD file is derived from [2] and is also within the tolerance requirements of the shapes of [1] and [3].

#### Conformity

Based on the sample tests above, we certify that this item is in compliance with the uncertainty requirements of SAR measurements specified in standard [1] and draft standards [2] and [3].
