Note: 1. The statements of test result on the above are decided by the request of test standard only; the measurement uncertainties are not factored into this compliance determination.

2. The information of measurement uncertainty is available upon the customer's request.

#### **Deviation from Applicable Standard**

None

The above equipment has been tested by Compliance Certification Services Inc., and found compliance with the requirements set forth in the technical standards mentioned above. The results of testing in this report apply only to the product/system, which was tested. Other similar equipment will not necessarily produce the same results due to production tolerance and measurement uncertainties.

| Brand Name       | lenovo                              |
| Model            | SM-8860                             |
| Applicant        | LITE-ON Technology Corp.            |
| Serial Number    | T100705003                          |
| Received Date    | July 5, 2010                        |
| EUT Power Rating | Powered by AAA batteries (DC: 1.5V) |

#### I/O Port

| I/O PORT TYPES | Q'TY | TESTED WITH |
|----------------|------|-------------|
| N/A            |      |             |

Note: Client consigns only one model sample to test (Model Number: SM-8860).

# **3 TEST METHODOLOGY**

## 3.1. DECISION OF FINAL TEST MODE

1. The following test mode was scanned during the preliminary test:

Pre-Test Mode

Mode 1: Operating

2. After the preliminary scan, the following test mode was found to produce the highest emission level.

| Final Test Mode |                    |        |  |  |
|-----------------|--------------------|--------|--|--|
| Emission        | Conducted Emission | N/A    |  |  |
| Emission        | Radiated Emission  | Mode 1 |  |  |

Then, the above highest emission mode of the configuration of the EUT and cable was chosen for all final test items.

## 3.2. EUT SYSTEM OPERATION

| 1 | Setup the EUT and simulators as shown on 4.2.   |
|---|---|
| 2 | Insert dongle to Host PC.   |
| 3 | Turn on the power of all equipment.   |
| 4 | EMI test program was loaded and executed in "Windows XP" mode.  |
| 5 | Data was sent to EUT and filling the screen of monitor with upper case of "H" patterns.   |
| 6 | EUT was played music or movie during the test.  |
| 7 | Test program sequentially exercised all related I/O's of Host PC and sent "H" patterns to all applicable output ports of Host PC. |
| 8 | Repeat 4 to 7.  |
|   |   |

*Note:* Test program is self-repeating throughout the test.

# 4 SETUP OF EQUIPMENT UNDER TEST

## 4.1. DESCRIPTION OF SUPPORT UNITS

The EUT has been tested as an independent unit together with other necessary accessories or support units. The following support units or accessories were used to form a representative test configuration during the tests.

| No. | Device Type        | Brand  | Model      | Series No.                    | FCC ID     | Data Cable                  | Power Cord       |
|-----|--------------------|--------|------------|-------------------------------|------------|-----------------------------|------------------|
| 1.  | PC                 | HP     | dx7510     | SGH947PR1Y                    | FCC<br>DoC | N/A                         | Unshielded, 1.8m |
| 2.  | LCD Monitor        | DELL   | 2407WFPb   | CN-0FC255-46<br>633-675-22TJS | FCC<br>DoC | Shielded, 1.8m with 2 cores | Unshielded, 1.8m |
| 3.  | Printer            | EPSON  | STYLUS C60 | DR3K039633                    | FCC<br>DoC | Shielded, 1.8m              | Unshielded, 1.8m |
| 4.  | Modem              | ACEEX  | DM-1414    | 0405026756                    | IFAXDM1414 | Shielded, 1.8m              | Unshielded, 1.8m |
| 5   | USB Keyboard       | DELL   | Sk-8115    | N/A                           | FCC<br>DoC | Shielded, 1.8m              | N/A              |
| 6   | USB<br>Transceiver | Liteon | SD-9080    | N/A                           | H4IDG9080  | N/A                         | N/A              |
| 7   | Test Kit           | N/A    | N/A        | N/A                           | N/A        | N/A                         | N/A              |

**Note:** Grounding was established in accordance with the manufacturer's requirements and conditions for the intended use.

## 4.2. CONFIGURATION OF SYSTEM UNDER TEST

# 5 FACILITIES AND ACCREDITATIONS

## 5.1. FACILITIES

All measurement facilities used to collect the measurement data are located at:

No.11, Wugong 6th Rd., Wugu Industrial Park, Taipei Hsien 248, Taiwan

No.139, Wugong Rd., Wugu Industrial Park, Taipei Hsien 248, Taiwan

No. 81-1, Lane 210, Pa-De 2nd Rd., Luchu Hsiang, Taoyuan Shien, Taiwan.

No.163-1, Jhongsheng Rd., Sindian City, Taipei County 23151, Taiwan.

The sites are constructed in conformance with the requirements of ANSI C63.4 and CISPR 22. All receiving equipment conforms to CISPR 16-1-1, CISPR 16-1-2, CISPR 16-1-3, CISPR 16-1-4, CISPR 16-1-5.

## 5.2. ACCREDITATIONS

Our laboratories are accredited and approved by the following approval agencies according to ISO/IEC 17025.

| Taiwan | TAF (TAF 1309) |
|--------|----------------|
| USA    | A2LA (0824.01) |

The measuring facility of laboratories has been authorized or registered by the following approval agencies.

| Canada | Industry Canada<br>(3M Semi Anechoic Chamber: IC 2324G-1 / IC 2324G-2 / 2324J-1 /<br>2324J-2 to perform)  |
|--------|---|
| Norway | Nemko   |
| Japan  | VCCI<br>966 Chamber C:<br>Radiated emissions: 30 MHz -1000 MHz: R-3282 / Above 1GHz: G-146<br>10M Chamber:<br>Radiated emissions: 30 MHz -1000 MHz: R-3283 / Above 1GHz: G-147<br>Conducted Emission A: C-3612 / T-1745 |
| USA    | FCC<br>(3M Semi Anechoic Chamber (FCC MRA: TW1039) to perform FCC<br>Part 15 measurements)  |

Copies of granted accreditation certificates are available for downloading from our web site, <u>http:///www.ccsrf.com</u>

## **5.3. MEASUREMENT UNCERTAINTY**

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2:

| Measurement          | Frequency   | Uncertainty |
|----------------------|-------------|-------------|
| Conducted emissions  | 9kHz~30MHz  | N/A         |
| Dedicted emissions # | 30~200MHz   | ±3.9642     |
| Mugu 10M Chambor     | 200~1000MHz | ±3.9510     |
|                      | Above 1GHz  | ±2.4656     |

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

Consistent with industry standard (e.g. CISPR 22: 2006, clause 11, Measurement Uncertainty) determining compliance with the limits shall be base on the results of the compliance measurement. Consequently the measure emissions being less than the maximum allowed emission result in this be a compliant test or passing test.

The acceptable measurement uncertainty value without requiring revision of the compliance statement is base on conducted and radiated emissions being less than  $U_{CISPR}$  which is 3.6dB and 5.2dB respectively. CCS values (called  $U_{Lab}$  in CISPR 16-4-2) is less than  $U_{CISPR}$  as shown in the table above. Therefore, MU need not be considered for compliance.

# **6** CONDUCTED EMISSION MEASUREMENT

## 6.1. LIMITS OF CONDUCTED EMISSION MEASUREMENT

|            | Class /    | A (dBuV) | Class B (dBuV) |         |  |
|------------|------------|----------|----------------|---------|--|
|            | Quasi-peak | Average  | Quasi-peak     | Average |  |
| 0.15 - 0.5 | 79         | 66       | 66 - 56        | 56 - 46 |  |
| 0.50 - 5.0 | 73         | 60       | 56             | 46      |  |
| 5.0 - 30.0 | 73         | 60       | 60             | 50      |  |

#### NOTE:

(1) The lower limit shall apply at the transition frequencies.

(2) The limit decreases in line with the logarithm of the frequency in the range 0.15 to 0.50 MHz.

(3) All emanations from a class A/B digital device or system, including any network of conductors and apparatus connected thereto, shall not exceed the level of field strengths specified above.

## **6.2. TEST INSTRUMENTS**

| Conducted Emission Room |              |       |               |                 |  |  |
|-------------------------|--------------|-------|---------------|-----------------|--|--|
| Name of Equipment       | Manufacturer | Model | Serial Number | Calibration Due |  |  |
| N/A                     |              |       |               |                 |  |  |

#### 6.3. TEST PROCEDURES (please refer to measurement standard or CCS SOP PA-031)

#### Procedure of Preliminary Test

- The EUT and support equipment, if needed, were set up as per the test configuration to simulate typical usage per the user's manual. When the EUT is a tabletop system, a wooden table with a height of 0.8 meters is used and is placed on the ground plane as per ANSI C63.4 (see Test Facility for the dimensions of the ground plane used). When the EUT is a floor standing equipment, it is placed on the ground plane, which has a 12 mm non-conductive covering to insulate the EUT from the ground plane.
- All I/O cables were positioned to simulate typical actual usage as per ANSI C63.4.
- The test equipment EUT installed by AC 120VAC/60Hz main power, through a Line Impedance Stabilization Network (LISN), which was supplied power source and was grounded to the ground plane.
- All support equipment power by from a second LISN.
- The test program of the EUT was started. Emissions were measured on each current carrying line of the EUT using an EMI Test Receiver connected to the LISN powering the EUT.
- The Receiver scanned from 150kHz to 30MHz for emissions in each of the test modes.
- During the above scans, the emissions were maximized by cable manipulation.
- The test mode(s) described in Item 3.1 were scanned during the preliminary test.
- After the preliminary scan, we found the test mode described in Item 3.1 producing the highest emission level.
- The worst configuration of EUT and cable of the above highest emission level were recorded for reference of the final test.

#### Procedure of Final Test

- EUT and support equipment were set up on the test bench as per the configuration with highest emission level in the preliminary test.
- A scan was taken on both power lines, Line 1 and Line 2, recording at least the six highest emissions. Emission frequency and amplitude were recorded into a computer in which correction factors were used to calculate the emission level and compare reading to the applicable limit.
- The test data of the worst-case condition(s) was recorded.

## 6.4. TEST SETUP

• For the actual test configuration, please refer to the related item – Photographs of the Test Configuration.

### 6.5. DATA SAMPLE:

....

. .

| = Emission frequency in MHz  |
|--|
| = Uncorrected Analyzer/Receiver reading + Insertion loss of LISN, if it > 0.5 dB |
| = LISN Factor + Cable Loss   |
| = Raw reading converted to dBuV and CF added                                     |
| = Limit stated in standard   |
| = Result (dBuV) – Limit (dBuV)   |
|  |

## 6.6. TEST RESULTS

Not applicable, because EUT does not connect to AC Main Source direct.

# 7 RADIATED EMISSION MEASUREMENT

## 7.1. LIMITS OF RADIATED EMISSION MEASUREMENT

According to FCC Part 15.33 (b), for an unintentional radiator, including a digital device, the spectrum shall be investigated from the lowest radio frequency signal generated or used in the device, without going below the lowest frequency for which a radiated emission limit is specified, up to the frequency shown in the following table:

| Highest frequency generated or used in the device or on which the device operates or tunes (MHz) | Upper frequency of measurement range<br>(MHz)                                  |
|--|--|
| Below 1.75   | 30   |
| 1.75-108   | 1000   |
| 108-500  | 2000   |
| 500-1000   | 5000   |
| Above 1000   | 5 <sup>th</sup> harmonic of the highest frequency or 40GHz, whichever is lower |

#### Below 1GHz (for digital device)

|            | dBuV/m (At 10m) |         |  |  |
|------------|-----------------|---------|--|--|
|            | Class A         | Class B |  |  |
| 30 ~ 230   | 40              | 30      |  |  |
| 230 ~ 1000 | 47              | 37      |  |  |

## Limit tables for non-digital device: Class A Radiated Emission limit at 10m (for others)

| Frequency<br>(MHZ) | Field Strength Limit<br>(uV/m)Q.P. | Field Strength Limit<br>(dBuV/m)Q.P. |
|--------------------|------------------------------------|--------------------------------------|
| 30 - 88            | 90                                 | 39                                   |
| 88 - 216           | 150                                | 43.5                                 |
| 216 – 960          | 210                                | 46.4                                 |
| Above 960          | 300                                | 49.5                                 |

#### Class B Radiated Emission limit at 3m (for others)

| Frequency<br>(MHZ) | Field Strength Limit<br>(uV/m)Q.P. | Field Strength Limit<br>(dBuV/m)Q.P. |
|--------------------|------------------------------------|--------------------------------------|
| 30 - 88            | 100                                | 40                                   |
| 88 - 216           | 150                                | 43.5                                 |
| 216 – 960          | 200                                | 46                                   |
| Above 960          | 500                                | 54                                   |

#### Above 1GHz(for all device)

| Frequency  | quency Class A (dBuV/m) (At 10m) |      |         | uV/m) (At 3m) |  |
|------------|----------------------------------|------|---------|---------------|--|
| (MHZ)      | Average Peak                     |      | Average | Peak          |  |
| Above 1000 | 49.5                             | 69.5 | 54      | 74            |  |

**NOTE**: (1) The lower limit shall apply at the transition frequencies.

(2) Emission level (dBuV/m) = 20 log Emission level (uV/m).

(3) The measurement above 1GHz is at close-in distances 3m,and determine the limit L2 corresponding to the close-in distance d2 by applying the following relation: L2 = L1 (d1/d2), where L1 is the specified limit in microvolts per metre (uV/m) at the distance d1 (10m), L2 is the new limit for distance d2 (3m).

So the new Class A limit above 1GHz at 3m is as following table:

| Frequency  | Class A (dBuV/m) (At 3m) |      |  |  |
|------------|--------------------------|------|--|--|
| (MHZ)      | Average                  | Peak |  |  |
| Above 1000 | 60                       | 80   |  |  |

**NOTE:** 1. The calibration interval of the above test instruments is 12 months and the calibrations are traceable to NML/ROC and NIST/USA.

2. N.C.R = No Calibration Request.

#### 7.3. TEST PROCEDURES (please refer to measurement standard or CCS SOP PA-031)

#### Procedure of Preliminary Test

- The equipment was set up as per the test configuration to simulate typical usage per the user's manual. When the EUT is a tabletop system, a wooden turntable with a height of 0.8 meters is used which is placed on the ground plane. When the EUT is a floor standing equipment, it is placed on the ground plane which has a 12 mm non-conductive covering to insulate the EUT from the ground plane.
- Support equipment, if needed, was placed as per ANSI C63.4.
- All I/O cables were positioned to simulate typical usage as per ANSI C63.4.
- The EUT received AC 120VAC/60Hz power source from the outlet socket under the turntable. All support equipment power received from another socket under the turntable.
- The antenna was placed at 3 or 10 meter away from the EUT as stated in ANSI C63.4. The antenna connected to the Spectrum Analyzer via a cable and at times a pre-amplifier would be used.
- The Analyzer / Receiver quickly scanned from 30MHz to 40GHz. The EUT test program was started. Emissions were scanned and measured rotating the EUT to 360 degrees and positioning the antenna 1 to 4 meters above the ground plane, in both the vertical and the horizontal polarization, to maximize the emission reading level.
- The test mode(s) described in Item 3.1 were scanned during the preliminary test:
- After the preliminary scan, we found the test mode described in Item 3.1 producing the highest emission level.
- The worst configuration of EUT and cable of the above highest emission level were recorded for reference of the final test.

#### Procedure of Final Test

- EUT and support equipment were set up on the turntable as per the configuration with highest emission level in the preliminary test.
- The Analyzer / Receiver scanned from 30MHz to 40GHz. Emissions were scanned and measured rotating the EUT to 360 degrees, varying cable placement and positioning the antenna 1 or 1 to 4 meters above the ground plane, in both the vertical and the horizontal polarization, to maximize the emission reading level.
- Recording at least the six highest emissions. Emission frequency, amplitude, antenna position, polarization and turntable position were recorded into a computer in which correction factors were used to calculate the emission level and compare reading to the applicable limit and only Q.P. reading is presented.
- The test data of the worst-case condition(s) was recorded.

#### **REMARKS:**

1. The other emission levels were very low against the limit.

2. Average test would be performed if the peak result were greater than the average limit.

3. Data of measurement within this frequency range shown " --- " in the table above means the reading of emissions are attenuated more than 20dB below the permissible limits or the field strength is too small to be measured.

4. Margin (dB) = Result (dBuV/m) – Limit (dBuV/m)

#### **REMARKS**:

1. The other emission levels were very low against the limit.

2. Average test would be performed if the peak result were greater than the average limit.

3. Data of measurement within this frequency range shown " ---- " in the table above means the reading of emissions are attenuated more than 20dB below the permissible limits or the field strength is too small to be measured.

4. Margin (dB) = Result (dBuV/m) – Limit (dBuV/m)

# 8 PHOTOGRAPHS OF THE TEST CONFIGURATION

**RADIATED EMISSION TEST**
