5.5 Spurious Emissions - Radiated - (9kHz - 25GHz)

5.5.1 Test Procedure [FCC 15.205/209/247(d), IC RSS-210 A8.5, RSS-Gen 4.9&4.10]

Radiated emission measurements are performed at 3m distance with the broadband antenna (Loop antenna, Biconical antenna, log-periodic antenna and double-ridged guide antenna). The antenna is positioned both the horizontal and vertical planes of polarization and height is varied 1 to 4 meters and stopped at height producing the maximum emission. As for the Loop antenna, it is positioned with its plane vertical, and the center of the Loop is 1.0meter above the ground plane. Frequency Range: 9kHz -1GHz is scanned and investigated with the test receiver, and above 1GHz, with the spectrum analyzer. The detector function of the test receiver is set to CISPR Quasi-peak mode and the bandwidth is set to 120kHz. Peak and average detectors are used for measurements above 1GHz. The bandwidth of the spectrum analyzer is set to 1MHz.

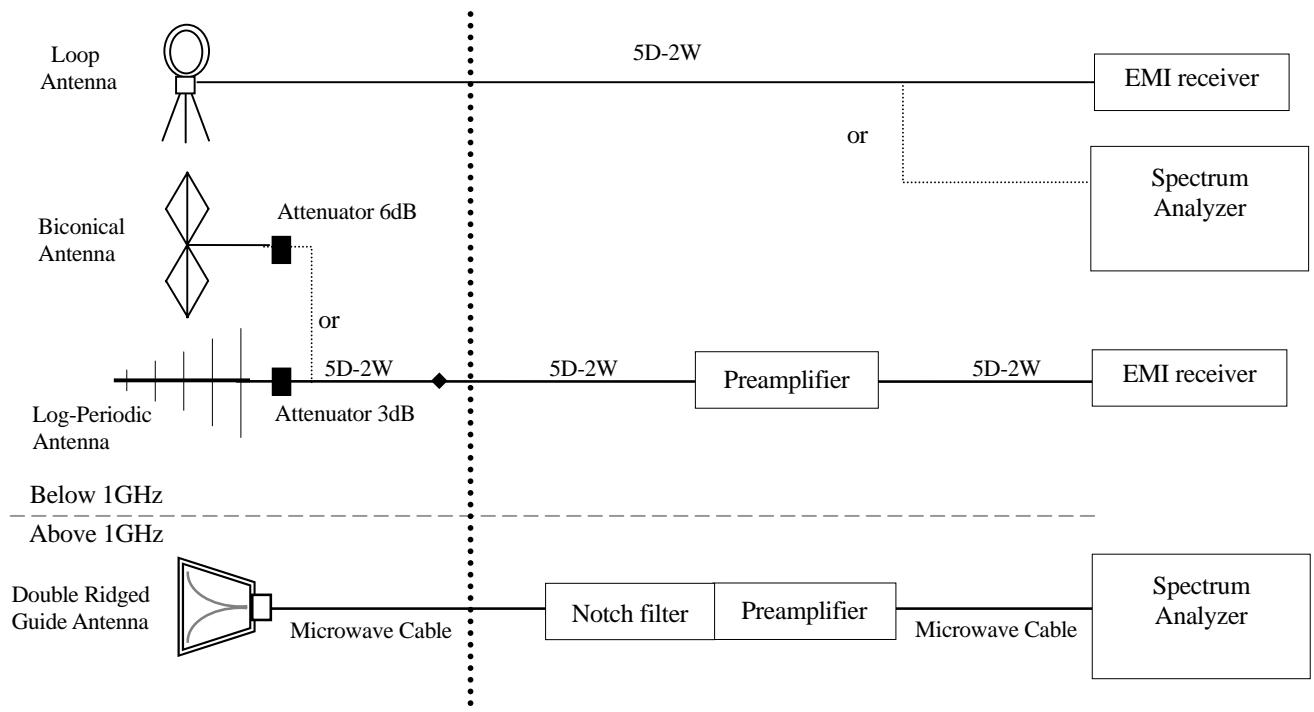

The EUT and support equipment are placed on a 1 meter x 1 meter surface, 0.8meter height styrene form table. The turntable is rotated by 360 degrees and stopped at azimuth of producing the maximum emission.

Interconnecting cables, which hanging closer than 40cm to the horizontal metal ground plane are bundled its excess in center. The highest fundamental frequency generated in the EUT is 2412-2462MHz, therefore the frequency was investigated up to 25GHz, as specified in CFR47 section 15.33, and at least six highest emissions are reported. The test results represent the worst-case emission for each emission with manipulating the EUT, support equipment, interconnecting cables and varying the mode of operation.

Sufficient time for the EUT, support equipment, and test equipment are allowed in order for them to warm up to their normal operating condition.

5.5.2 Measurement Setup

Test configuration for Spurious emissions

5.5.3 Limit of Spurious Emission Measurement

Frequency [MHz]	Field Strength	
	[μ V/m]	[dB μ V/m]
0.009 – 0.490	2400 / F [kHz]	20logE [μ V/m]
0.490 – 1.705	24000 / F [kHz]	20logE [μ V/m]
1.705-30	30	29.5
30 – 88	100	40.0
88 – 216	150	43.5
216 – 960	200	46.0
Above 960	500	54.0

NOTE:

1. The lower limit shall apply at the transition frequencies.
2. Emission level [dB μ V/m] = 20 log Emission [μ V/m]
3. As shown in 15.35(b), for frequencies above 1000MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20dB under any condition of modulation.

5.5.4 Sample of field strength calculation

$$\text{Spurious Emission} \quad \boxed{\text{dB}\mu\text{V}/\text{m} = 20\log_{10}(\mu\text{V}/\text{m})}$$

Limit @ 147.6MHz = $150\mu\text{V}/\text{m} = 43.5\text{dB}\mu\text{V}/\text{m}$
Reading = $42.8\text{dB}\mu\text{V}$
Ant. Factor + Cable Loss - Amp. Gain = $14.2 + 3.0 - 30.0 = -12.8\text{dB}$
Total = $42.8 - 12.8 = 30.0\text{dB}\mu\text{V}/\text{m}$
Margin = $43.5 - 30.0 = \underline{13.5\text{dB}}$

5.8 AC power line Conducted Emissions

5.8.1 Test Procedure [FCC 15.207, IC RSS-Gen 7.2.2]

Conducted emissions at AC mains port measurements are performed at 3m Semi-anechoic chamber according to ANSI C63.4 section 7.

EUT and support equipment are placed on FRP table of 2.0m(W) × 1.0m(D) × 0.8m(H) in size. EUT is connected to $50\Omega/50\mu\text{H}$ Line Impedance Stabilization Network (LISN) which is placed on reference ground plane, and was placed 80cm away from EUT. Excess of AC power cable is bundled in center. Vertical Metal Reference Plane 2.0m (W) × 2.0m (H) in size is placed 0.4m away from EUT. LISN for peripheral is terminated in 50Ω .

EUT operating mode is selected to emit the maximum noise. Overall frequency range is investigated with spectrum analyzer using peak detector. Maximum emission configuration is determined by manipulating the EUT, support equipment, interconnecting cables. Then, emission measurements are performed with test receiver in above setting to each current-carrying conductor of the mains port. Sufficient time for EUT, support equipment and test equipment are provided in order for them to warm up to their normal operating condition.

Frequency range:

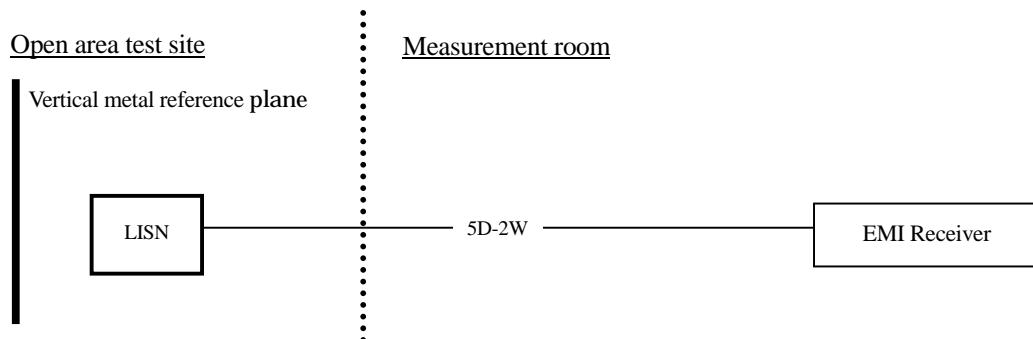

- 0.15MHz to 30MHz

The Test receiver is set to:

- Detector: Quasi-peak, Average
- Bandwidth: 9kHz

5.9 Antenna requirement

According to FCC section 15.203., an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

The antenna has a U.FL type connector and antenna will be internal in the host equipment and inaccessible by the user. Therefore, the EUT complies with the antenna requirement of FCC section 15.203.

6. Uncertainty of measurement

Expanded uncertainties stated were calculated with a coverage Factor k=2.

Please note that these results are not taken into account when determining compliance or non-compliance with test result.

Test item	Measurement uncertainty
Conducted emission at mains port (150kHz - 30MHz)	±3.7dB
Radiated emission (9kHz - 30MHz)	±4.4dB
Radiated emission (30MHz – 1000MHz)	±5.3dB
Radiated emission (1000MHz – 26GHz)	±3.9dB
