CERTIFICATE OF COMPLIANCE (SAR EVALUATION)

Dates of Tests: December 05, 2001, January 22,23&31, 2002
Report No: 01U1047-1

APPLICANT:	**SYMBOL TECHNOLOGIES, INC.**
	6480 VIA DEL ORO DRIVE
	SAN JOSE, CA 95119 - 1208
TRADE NAME:	**SYMBOL TECHNOLOGIES, INC.**
MODEL:	**LA4137**
SERIAL NUMBER:	**N/A**
FCC ID:	**H9PLA4137**
CATEGORY:	**2.4GHz DSSS WIRELESS Tx/Rx MODULE**

Test Sample is a:	**Pre-Production Unit**
Tx Frequency:	**2412 – 2462 MHz**
Max. RF Output Power:	**19.74 dBm (Antenna Port #1) & 20.39 dBm (Antenna Port #2)**
	based on Conducted Output Power Measurements
FCC Classification:	**Unlicensed Intentional Radiator**
RF Exposure environment:	**General Population/Uncontrolled**
Application Type:	**Certification**
FCC Rule Part(s):	**§ 15.247**
Separation Distance:	**20 mm**
SAR Limits:	**1.6mW/g**
Worse Body-Worn SAR:	**1.16mW/g @low channel/5.5Mbps**

This wireless module has been tested according to the client's specification as recorded in respective section in this report and in accordance with the measurement procedures specified in the FCC OET 65 Supplement C (released on 6/29/2001 see Test Report).

The worst-case Body-Worn, with 20mm separation distance, SAR readings reported herein is 1.16mW/g at low channel(2412MHz) with data rate of 5.5Mbps. Additional test data / configuration are included to provide the reference information for the manufacturer as well for regulatory agencies.

I attest to the accuracy of data. All measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

Steve Cheng
EMC Engineering Manager

1. EUT DESCRIPTION

APPLICANT:	**SYMBOL TECHNOLOGIES, INC.**
	6480 VIA DEL ORO DRIVE
	SAN JOSE, CA 95119 - 1208
TRADE NAME:	**SYMBOL TECHNOLOGIES, INC.**
MODEL:	**LA4137**
SERIAL NUMBER:	**N/A**
FCC ID:	**H9PLA4137**
CATEGORY:	**2.4GHz DSSS WIRELESS Tx/Rx MODULE**

Test Sample is a: Pre-Production Unit
EUT Type: 2.4GHz DSSS Tx/Rx module
Trade Name: Symbol Technologies, Inc.
Model(s):   LA4137
FCC IDENTIFIER: H9PLA4137
S/N: N/A (Pre-Production)
Tx Frequency: 2412 – 2462 MHz
Application Type: Certification
FCC Classification: Unlicensed Intentional Radiator
Modulation(s):   IEEE 802.11b
FCC Rule Part(s):   § 15.247
Max. RF Output Power: 19.74 dBm (Ant.Port #1) & 20.39 dBm (Ant.Port #2)
                       based on Conducted Output Power Measurements
Antenna Type & Gain: Sleeved dipole, 2 dBi
Antenna Dimensions: Length: 100 mm; Diameter: 2.18mm at center
Dates of Tests: December 05, 2001, January 22,23, 31, 2002
Report Project No.:   01U1047-1

[1] Specific Absorption Rate (SAR) is a measure of the rate of energy absorption due to exposure to an RF transmitting source (wireless portable device).
[2] IEEE/ANSI Std. C95.1-1992 limits are used to determine compliance with FCC ET Docket 93-62.

2. REQUIREMENTS FOR COMPLIANCE TESTING DEFINED BY THE FCC

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996 [1]. The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g as recommended by the ANSI/IEEE standard C95.1-1992 [6] for an uncontrolled environment (Paragraph 65). According to the Supplement C of OET Bulletin 65 "Evaluating Compliance with FCC Guide-lines for Human Exposure to Radio frequency Electromagnetic Fields", released on Jun 29, 2001 by the FCC, the device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling.

3. DOSIMETRIC ASSESSMENT SETUP

These measurements were performed with the automated near-field scanning system DASY3 from Schmid & Partner Engineering AG (SPEAG). The system is based on a high precision robot (working range greater than 0.9 m) which positions the probes with a positional repeatability of better than ± 0.02 mm. Special E- and H-field probes have been developed for measurements close to material discontinuity, the sensors of which are directly loaded with a Schottky diode and connected via highly resistive lines to the data acquisition unit. The system is described in detail in [3].

The SAR measurements were conducted with the dosimetric probe ET3DV6 SN: 1577 (manu-factured by SPEAG), designed in the classical triangular configuration [3] and optimized for dosimetric evaluation. The probe has been calibrated according to the procedure described in [7] with accuracy of better than ±10%. The spherical isotropy was evaluated with the procedure described in [8] and found to be better than ±0.25 dB.

The phantom used was the \Generic Twin Phantom" described in [4]. The ear was simulated as a spacer of 4 mm thickness between the earpiece of the phone and the tissue simulating liquid. The Tissue simulation liquid used for each test is in according with the FCC OET65 supplement C as listed below.

Ingredients (% by weight)	Frequency (MHz)									
	450		835		915		1900		2450

3.1.   MEASUREMENT SYSTEM DIAGRAM
**The DASY3 system for performing compliance tests consist of the following items:**

1. A standard high precision 6-axis robot (Stäubli RX family) with controller and software.
2. An arm extension for accommodating the data acquisition electronics (DAE).
3. A dosimetric probe, i.e., an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.
4. A data acquisition electronic (DAE), which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
5. A unit to operate the optical surface detector, which is connected to the EOC.
    The Electro-optical coupler (EOC) performs the conversion from the optical into a digital electric signal of the DAE. The EOC is connected to the PC plug-in card.
    The functions of the PC plug-in card based on a DSP is to perform the time critical task such as signal filtering, surveillance of the robot operation fast movement interrupts.
6. A computer operating Windows 95 or larger
7. DASY3 software
8. Remote control with teaches pendant and additional circuitry for robot safety such as warning lamps, etc.
9. The generic twin phantom enabling testing left-hand and right-hand usage.
10. The device holder for handheld EUT.
11. Tissue simulating liquid mixed according to the given recipes (see Application Note).
12. System validation dipoles to validate the proper functioning of the system.

3.2.   SYSTEM COMPONENTS

ET3DV5 Probe Specification

Construction Symmetrical design with triangular core
Built-in optical fiber for surface detection System
Built-in shielding against static charges
Calibration In air from 10 MHz to 2.5 GHz
In brain and muscle simulating tissue at
Frequencies of 450 MHz, 900 MHz and
1.8 GHz (accuracy $\pm 8\%$)
Frequency 10 MHz to > 6 GHz; Linearity: ± 0.2 dB
(30 MHz to 3 GHz)
Directivity ± 0.2 dB in brain tissue (rotation around probe axis)
± 0.4 dB in brain tissue (rotation normal probe axis)
Dynamic 5 mW/g to > 100 mW/g;
Range Linearity: ± 0.2 dB
Surface ± 0.2 mm repeatability in air and clear liquids
Detection over diffuse reflecting surfaces.
Dimensions Overall length: 330 mm
Tip length: 16 mm
Body diameter: 12 mm
Tip diameter: 6.8 mm
Distance from probe tip to dipole centers: 2.7 mm
Application General dosimetric up to 3 GHz
Compliance tests of mobile phones
Fast automatic scanning in arbitrary phantoms

Photograph of the probe

The SAR measurements were conducted with the dosimetric probe ET3DV6 designed in the classical triangular configuration and optimized for dosimetric evaluation. The probe is constructed using the thick film technique; with printed resistive lines on ceramic substrates. The probe is equipped with an optical multi-fiber line ending at the front of the probe tip. It is connected to the EOC box on the robot arm and provides an automatic detection of the phantom surface. Half of the fibers are connected to a pulsed infrared transmitter, the other half to a synchronized receiver. As the probe approaches the surface, the reflection from the surface produces a coupling from the transmitting to the receiving fibers. This reflection increases first during the approach, reaches maximum and then decreases. If the probe is flatly touching the surface, the coupling is zero. The distance of the coupling maximum to the surface is independent of the surface reflectivity and largely independent of the surface to probe angle. The DASY3 software reads the reflection during a software approach and looks for the maximum using a 2 nd order fitting. The approach is stopped when reaching the maximum.
**Inside view of
ET3DV6 E-field Probe**

E-Field Probe Calibration Process

Each probe is calibrated according to a dosimetric assessment procedure described in [6] with accuracy better than +/- 10%. The spherical isotropy was evaluated with the procedure described in [7] and found to be better than +/-0.25dB. The sensitivity parameters (NormX, NormY, NormZ), the diode compression parameter (DCP) and the conversion factor (ConvF) of the probe are tested.

The free space E-field from amplified probe outputs is determined in a test chamber. This is performed in a TEM cell for frequencies bellow 1 GHz, and in a waveguide above 1 GHz for free space. For the free space calibration, the probe is placed in the volumetric center of the cavity and at the proper orientation with the field. The probe is then rotated 360 degrees.

E-field temperature correlation calibration is performed in a flat phantom filled with the appropriate simulated brain tissue. The measured free space E-field in the medium correlates to temperature rise in dielectric medium. For temperature correlation calibration a RF transparent thermistor-based temperature probe is used in conjunction with the E-field probe.

Data Evaluation

The DASY3 software automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software:

Probe parameters:	- Sensitivity	$Norm_i$, a_{i0}, a_{i1}, a_{i2}
	- Conversion factor	$ConvF_i$
	- Diode compression point	Dcp_i
Device parameters:	- Frequency	f
	- Crest factor	cf
Media parameters:	- Conductivity	σ
	- Density	ρ

These parameters must be set correctly in the software. They can either be found in the component documents or be imported into the software from the configuration files issued for the DASY3 components. In the direct measuring mode of the multi-meter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as:

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$$

with	V_i	= compensated signal of channel i	(i = x, y, z)
	U_i	= input signal of channel i	(i = x, y, z)
	cf	= crest factor of exciting field	(DASY parameter)
	dcp_i	= diode compression point	(DASY parameter)

From the compensated input signals the primary field data for each channel can be evaluated:

E-field probes:

$$E_i = \sqrt{\frac{V_i}{Norm_i \cdot ConvF}}$$

H-field probes:

$$H_i = \sqrt{Vi} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{f}$$

with V_i = compensated signal of channel i   (i = x, y, z)
           $Norm_i$ = sensor sensitivity of channel i   (i = x, y, z)
               $\mu V/(V/m)^2$ for E-field Probes
           ConvF = sensitivity enhancement in solution
           a_{ij} = sensor sensitivity factors for H-field probes
           f   = carrier frequency [GHz]
           E_i = electric field strength of channel i in V/m
           H_i = magnetic field strength of channel i in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1000}$$

with   SAR   = local specific absorption rate in mW/g
           E_{tot} = total field strength in V/m
           σ = conductivity in [mho/m] or [Siemens/m]
           ρ = equivalent tissue density in g/cm^3

Note that the density is normally set to 1 (or 1.06), to account for actual brain density rather than the density of the simulation liquid.
The power flow density is calculated assuming the excitation field as a free space field.

$$P_{pwe} = \frac{E_{tot}^2}{3770} \qquad \text{or} \qquad P_{pwe} = H_{tot}^2 \cdot 37.7$$

with P_{pwe} = equivalent power density of a plane wave in mW/cm^2
           E_{tot} = total electric field strength in V/m
           H_{tot} = total magnetic field strength in A/m

Generic Twin Phantom

The Generic Twin Phantom is constructed of a fiberglass shell integrated in a wooden table. The shape of the shell is based on data from an anatomical study designed to determine the maximum exposure in at least 90% of all users [9][10]. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents the evaporation of the liquid. Reference markings on the Phantom allows the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot.
Shell Thickness 2 ± 0.1 mm
Filling Volume Approx. 20 liters
Dimensions 810 x 1000 x 500 mm (H x L x W)

Generic Twin Phantom

Device Holder for Transmitters

In combination with the Generic Twin Phantom V3.0, the Mounting Device enables the rotation of the mounted transmitter in spherical coordinates whereby the rotation points is the ear opening. The devices can be easily, accurately, and repeatedly positioned according to the FCC and CENELEC specifications. The device holder can be locked at different phantom locations (left head, right head, flat phantom).

* Note: A simulating human hand is not used due to the complex anatomical and geometrical structure of the hand that may produced infinite number of configurations [10]. To produce the worst-case condition (the hand absorbs antenna output power), the hand is omitted during the tests.
Device Holder

3.3.   EUT ARRANGEMENT

The EUT is a Wireless Tx/Rx Module, and the separation distance to the user is:

☒ Application dependent. A pre-determined separation distances of 0, 10,and 20 mm are set to evaluate the SAR.

☐ Is allocated more than 20 cm away from the user. But in considering the possibility that when it was sited on the desk corner, the people walk around or stand in front of the desk may expose to the near field radiation. For this reasons a pre-determined separation distance of 0, 5, 10, 15 mm are set to evaluate the SAR.

☐ The EUT is placed into the holster/belt clip and the holster is positioned against the surface of the phantom in a normal operating position.

☐ Since this EUT doesn't supply any body-worn accessory to the end user, a distance of 15 mm was tested to confirm the necessary "minimum SAR separation distance". (Note: this distance includes the 2 mm phantom shell thickness).The Ear-Microphone wire is then connected to the phone to simulate hands-free operation in a body-worn configuration.

SETUP PHOTO: Flat Phantom Configuration (0mm Separation)

This report shall not be reproduced except in full, without the written approval of CCS. This document may be altered or revised by Compliance Certification Services personnel only, and shall be noted in the revision section of the document.

Flat Phantom Configuration (10mm Separation)

Desktop Configuration (20mm Separation)
Measurement Uncertainty

The uncertainty budget has been determined for the DASY3 measurement system according to the NIS81 [13] and the NIST1297 [14] documents and is given in the following Table.

Uncertainty Description	Error	Distrib.	Weight	Std. Dev.	Offset
Probe Uncertainty					
Axial isotropy	± 0.2 dB	U-shape	0.5	±2.4 %	
Spherical isotropy	±0.4 dB	U-shape	0.5	±4.8 %	
Isotropy from gradient	±0.5 dB	U-shape	0		
Spatial resolution	±0.5 %	Normal	1	±0.5 %	
Linearity error	±0.2 dB	Rectangle	1	±2.7 %	
Calibration error	±3.3 %	Normal	1	± 3.3 %	
SAR Evaluation Uncertainty					
Data acquisition error	±1%	Rectangle	1	±0.6 %	
ELF and RF disturbances	±0.25 %	Normal	1	±0.25 %	
Conductivity assessment	±10 %	Rectangle	1	± 5.8 %	
Spatial Peak SAR Evaluation Uncertainty					
Extrapol boundary effect	±3%	Normal	1	±3%	± 5%
Probe positioning error	±0.1 mm	Normal	1	± 1%	
Integrat. and cube orient	±3%	Normal	1	±3%	
Cube shape inaccuracies	±2%	Rectangle	1	±1.2 %	
Device positioning	±6%	Normal	1	± 6%	
Combined Uncertainties			**1**	**±11.7 %**	**± 5%**
Extended uncertainty (K = 2)				**± 23.5 %.**	

4. EUT TUNE-UP PROCEDURE

The following procedures had been used to prepare the EUT for the SAR test.

a. Under the Dos program, type in "LA4137" to get into the main menu program.
b. On the main menu, choose "Continuous TX' and press "Enter"
c. Choose the "Frequency" and key in the channel # as "2412 = Low; 2437 = Middle; 2462 = High".
d. Choose the "Antenna Mode" either #1 or #2 by press "Enter".
e. Choose the "Data Rate" for 1, 2, 5.5, 11 MB/S by press "Enter"
f. Then, Press "Enter" on "Transmit State" to activate the continuous transmitting signal.
g. This EUT has two antenna output ports (ant-1 & ant-2). Only one antenna was installed to the module at any giving time to evaluate the SAR emission.
Antenna port location and antenna detailed dimension

Ps. the client supplied The EUT controller, PC, and the control software.

5. EVALUATION PROCEDURE

5.1.   SIMULATED TISSUE LIQUID PARAMETER CONFIRMATION

The dielectric parameters were checked prior to assessment using the HP85070A dielectric probe kit. The dielectric parameters measured are reported in each correspondent section:

5.2.   SYSTEM ACCURACY VERIFICATION

Prior to the assessment, the system validation kit was used to test whether the system was operating within its specifications of ±10%. The validation results are tabulated below. And also the corresponding SAR plot is attached as well in the SAR plots files.

IEEE P1528 recommended reference value

Frequency (MHz)	1 g SAR	10 g SAR	local SAR at surface (above feedpoint)	local SAR at surface (y=2cm offset from feedpoint)
300	3.0	2.0	4.4	2.1
450	4.9	3.3	7.2	3.2
835	9.5	6.2	14.1	4.9

5.3.   SAR EVALUATION PROCEDURE

The evaluation was performed with the following procedure:

  Step 1: Measurement of the SAR value at a fixed location above the ear point or central position was used as a reference value for assessing the power drop.
  Step 2: The SAR distribution at the exposed side of the head was measured at a distance of 3.9 mm from the inner surface of the shell. The area covered the entire dimension of the head or EUT and the horizontal grid spacing was 20 mm x 20 mm. Based on these data, the area of the maximum absorption was determined by spline interpolation.
  Step 3: Around this point, a volume of 32 mm x 32 mm x 34 mm was assessed by measuring 5 x 5 x 7 points. On the basis of this data set, the spatial peak SAR value was evaluated under the following procedure:
1. The data at the surface were extrapolated, since the center of the dipoles is 2.7 mm away from the tip of the probe and the distance between the surface and the lowest measuring point is 1.2 mm. The extrapolation was based on a least square algorithm [11]. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip.
2. The maximum interpolated value was searched with a straightforward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1 g or 10 g) were computed by the 3D-Spline interpolation algorithm. The 3D-Spline is composed of three one-dimensional splines with the "Not a knot"-condition (in x, y and z-directions) [11], [12]. The volume was integrated with the trapezoidal-algorithm. One thousand points (10 x 10 x 10) were interpolated to calculate the average.
3. All neighboring volumes were evaluated until no neighboring volume with a higher average value was found.
  Step 4: Re-measurement of the SAR value at the same location as in Step 1. If the value changed by more than 5%, the evaluation was repeated.

5.4. EXPOSURE LIMIT

(A) Limits for Occupational/Controlled Exposure (W/kg)

Whole-Body	Partial-Body	Hands, Wrists, Feet and Ankles
0.4	8.0	20.0

(B) Limits for General Population/Uncontrolled Exposure (W/kg)

Whole-Body	Partial-Body	Hands, Wrists, Feet and Ankles
0.08	1.6	4.0

NOTE 1: **Whole-Body SAR** is averaged over the entire body, **partial-body SAR** is averaged over any 1 gram of tissue defined as a tissue volume in the shape of a cube. **SAR for hands, wrists, feet and ankles** is averaged over any 10 grams of tissue defined as a tissue volume in the shape of a cube.

Population/Uncontrolled Environments: are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.
Occupational/Controlled Environments: are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

NOTE:
POPULATION/UNCONTROLLED ENVIRONMENTS
PARTIAL BODY LIMIT
1.6 mW/g

Measurement Detail

Worst-case configuration finding procedure:
1. H/M/L channels with highest data rate of antenna 1 checked first.
2. 1, 2, 5.5 and 11M bps data rates are than checked on the highest SAR channel found on step (1).
3. The highest SAR data rate is again used to scan H/M/L channels to determine the worst-case configuration.

Note: the following tests are used for evaluating the worst-case test configuration by performing SAR tests with different (0, 10, and 20 mm)separation distances to Flat Phantom. Different Data Rate at each separation distance were individually evaluated as well.

Antenna port 1:
Flat Phantom Configuration   Liquid depth: 15.2cm   Test date: 12/05/01

Mode	Position	Ch	Freq [MHz]	Liquid Temp [°C]	Conducted Power [dBm]		Worst case SAR, averaged over 1g [mW/g]				
							Set-up condition (applicable checked)				
					Before	After	Antenna	Rate (Mbps)	Sepa dist (mm)	Measured	Limit
1) SAR readings at Antenna Port #1, Data Rate 11Mbps 0 mm Separation Distance at Low, Middle , and High Channel											
IEEE 802.11b	Muscle	L	2412	22.3	19.74	19.74	1	11	0	5.54	1.6
IEEE 802.11b	Muscle	M	2437	22.3	19.38	19.38	1	11	0	4.09	1.6
IEEE 802.11b	Muscle	H	2462	22.3	19.35	19.35	1	11	0	4.61	1.6
2) SAR readings at Antenna Port #1, Data Rate 1,2,5.5, and 11 Mbps , 0 mm Separation Distance at Low Channel											
IEEE 802.11b	Muscle	L	2412	22.3	19.74	19.74	1	1	0	5.69	1.6
IEEE 802.11b	Muscle	L	2412	22.3	19.74	19.74	1	2	0	5.48	1.6
IEEE 802.11b	Muscle	L	2412	22.3	19.74	19.74	1	5.5	0	5.68	1.6
IEEE 802.11b	Muscle	L	2412	22.3	19.74	19.74	1	11	0	5.54	1.6
3) SAR readings at Antenna Port #1, Data Rate 1Mbps, 0 mm separation distance at Low Channel											
IEEE 802.11b	Muscle	L	2412	22.3	19.74	19.74	1	1	0	5.69	1.6
IEEE 802.11b	Muscle	M	2437	22.3	19.38	19.38	1	1	0	4.07	1.6
IEEE 802.11b	Muscle	H	2462	22.3	19.35	19.35	1	1	0	4.65	1.6

Antenna port 2:

Since we already know that the low channel produce the higher SAR as indicated in Antenna Port 1 evaluation, the following SAR evaluations have been performed to evaluate the SAR at Antenna Port 2:
1) 1,2,5.5 and 11Mbp with 0 mm separation distance at Low Channel
2) Once the highest SAR has been determined from item 1), evaluation specified data rate at low, middle and high channel

Flat Phantom Configuration   Liquid depth: 15.2cm   Test date: 12/05/01

Mode	Position	Ch	Freq [MHz]	Liquid Temp [°C]	Conducted Power [dBm]		Worst case SAR, averaged over 1g [mW/g]				
							Set-up condition (applicable checked)				
					Before	After	Antenna	Rate (Mbps)	Sepa dist (mm)	Measured	Limit
1)SAR Readings with 11,5.5,2, and 1 Mbps , 0 mm separation distance at Low channel											
IEEE 802.11b	Muscle	L	2412	22.4	19.68	19.68	2	11	0	5.69	1.6

IEEE 802.11b	Muscle	H	2462	22.4	19.95	19.95	2	5.5	0	4.81	1.6

<u>Worst-case configuration finding result:</u>

Through the SAR evaluation with 0mm separation distance performed at Antenna port 1 and Antenna port 2, we have found:
The highest SAR readings reported at Antenna Port 1 is 5.69mW/g at Low Channel with 1Mbps data rate.
The highest SAR readings reported at Antenna Port 2 is 5.96mW/g at Low Channel with 5.5Mbps data rate.

The above tests lead to the conclusion that the low channel with 5.5M bps on antenna 2 is the SAR worst-case configuration. This configuration would be use for the following final compliance test.

Final Test data
The following test data represents the EUT work at nominal separation distance of 10 and 20mm.
The following tests have performed :
1)Evaluate Antenna Port 2 with 5.5Mbps data rate , low channel at separation distance of 10mm.
2)Evaluate Antenna Port 2 with 1,2,5.5 and 11Mbps data rate with 20mm separation distance at low channel. The highest SAR reading has been determined at 5.5 data rate.
3)Evaluate worse SAR readings at 5.5Mbps data rate with 20mm separation distance at low, middle and high channel.

Flat Phantom Configuration   Liquid depth: 15.1cm   Test date: 1/31/02

Mode	Position	Ch	Freq [MHz]	Liquid Temp [°C]	Conducted Power [dBm] Before	After	Worst case SAR, averaged over 1g [mW/g] Antenna	Rate (Mbps)	Sepa dist (mm)	Measured	Limit
1)Investigate highest SAR readings with 5.5Mbps data rate with 10mm separation distance at low channel. Since the reported SAR reading is higher than specified SAR limits, only the following test was performed.											
IEEE 802.11b	Muscle	L	2412	22.4	19.68	19.68	2	5.5	10	<u>2.50</u>	1.6
2)Investigate highest SAR readings at 20mm separation distance with 1,2,5.5, and 11Mbps data rate

8.3   IEEE SCC-34/SC-2 P1528 RECOMMENDED TISSUE DIELECTRIC PARAMETERS

The head tissue dielectric parameters recommended by the IEEE SCC-34/SC-2 in P1528 have been incorporated in the following table. These head parameters are derived from planar layer models simulating the highest expected SAR for the dielectric properties and tissue thickness variations in a human head. Other head and body tissue parameters that have not been specified in P1528 are derived from the tissue dielectric parameters computed from the 4-Cole-Cole equations and extrapolated according to the head parameters specified in P1528.

Target Frequency	Head		Body	
(MHz)	ε_r	σ (S/m)	ε_r	σ (S/m)
150	52.3	0.76	61.9	0.80
300	45.3	0.87	58.2	0.92
450	43.5	0.87	56.7	0.94
835	41.5	0.90	55.2	0.97
900	41.5	0.97	55.0	1.05
915	41.5	0.98	55.0	1.06
1450	40.5	1.20	54.0	1.30
1610	40.3	1.29	53.8	1.40
1800 – 2000	40.0	1.40	53.3	1.52
2450	39.2	1.80	52.7	1.95
3000	38.5	2.40	52.0	2.73
5800	35.3	5.27	48.2	6.00

(ε_r = relative permittivity, σ = conductivity and ρ = 1000 kg/m^3)

Additional Conversion Factors
for Dosimetric E-Field Probe

|	
Type:	ET3DV6
Serial Number:	1577
Place of Assessment:	Zurich
Date of Assessment:	October 11, 2001
Probe Calibration Date:	April 20, 2001

Schmid & Partner Engineering AG hereby certifies that conversion factor(s) of this probe have been evaluated on the date indicated above. The assessment was performed using the FDTD numerical code SEMCAD of Schmid & Partner Engineering AG. Since the evaluation is coupled with measured conversion factors, it has to be recalculated yearly, i.e., following the re-calibration schedule of the probe. The uncertainty of the numerical assessment is based on the extrapolation from measured value at 900 MHz or at 1800 MHz.

DASY - DOSIMETRIC ASSESSMENT SYSTEM

CALIBRATION REPORT

DATA ACQUISITION ELECTRONICS

MODEL:	DAE3 V1
SERIAL NUMBER:	427

This Data Acquisition Unit was calibrated and tested using a FLUKE 702 Process Calibrator. Calibration and verification were performed at an ambient temperature of 23 ± 5 °C and a relative humidity of < 70%.

Measurements were performed using the standard DASY software for converting binary values, offset compensation and noise filtering. Software settings are indicated in the reports.

Results from this calibration relate only to the unit calibrated.

Calibrated by:	E. Meyer
Calibration Date:	April 27, 2001
DASY Software Version:	DASY3 V3.1c
