RELATED DOCUMENTS	ANSI C63.4 2001. Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

## **TEST RATIONALE**

The equipment comprises a Symbol VRC697C (containing a CISCO LM352 2.4GHz 11Mbps/sec Wireless LAN Module FCC ID LDK 102040) and Symbol LS 3000 Laser Scanner.

Section 3 of the report details testing carried out in accordance with:

- FCC: Part 15.247(c), Radiated Electric Field Emissions
- FCC: Part 15.247(b), Maximum Peak Output Power

## **SYSTEM CONFIGURATION DURING EMC TESTING**

The EUT was set-up simulating a typical user installation on the Alternative Open Field Test Site identified on page 26, and tested in accordance with the specification.

The EUT was set to transmit continuously on maximum output power during all testing. The EUT was powered via a 12V power supply unit. An LS3000 scanner was also used to exercise the unit during test.

Testing was carried out with the EUT transmitting on the following channels.

Channel 1: 2412MHz  
Channel 6: 2437MHz  
Channel 11: 2462MHz

## **RADIATED ELECTRIC FIELD EMISSIONS (Transmitter Portion)**

### **TEST PROCEDURE**

Testing to the requirements of FCC Part 15 Subpart C, Section 15.247(c), for Radiated Electric Field Emissions was carried out on the Measurement Test Facility detailed on page 26.

A preliminary profile of the Radiated Electric Field Emissions was obtained by operating the Equipment Under Test (EUT) on a remotely controlled turntable within a semi-anechoic chamber; measurements were taken at a 3m distance unless otherwise stated. Measurements of emissions from the EUT were obtained with the Measurement Antenna in both Horizontal and Vertical Polarisations. The profiling produced a list of the worst case emissions together with the EUT azimuth and antenna polarisation.

Using the information from the preliminary profiling of the EUT, a search was made in the frequency range 30MHz to 25GHz. The list of worst case emissions was then confirmed or updated under Open Site conditions. Emission levels were maximised by adjusting the antenna height, antenna polarisation and turntable azimuth. Emissions levels were then formally measured using a Quasi-Peak Detector which met the CISPR requirements in the frequency range 30MHz to 1000MHz and a peak detector in the frequency range 1GHz to 25GHz. The details of the worst case emissions were then recorded and are presented in Tables 1, 2 and 3.

The test was performed in accordance with ANSI C63.4.

Measurements were made with the EUT transmitting on the following channels.

Channel 1: 2412MHz  
Channel 6: 2437MHz  
Channel 11: 2462MHz

Radiated Emission from 1GHz to 25GHz were made using a Rohde & Schwarz ESIB40 Spectrum Analyser.

**TEST RESULTS**

Equipment Designation : Intentional Radiator.

The EUT met the requirements of FCC Part 15.247(c) for Radiated Electric Field Emissions.

The emissions were measured at 3m unless otherwise indicated.

**MAXIMUM PEAK OUTPUT POWER**

**TEST PROCEDURE**

Testing to the requirements of FCC Part 15 Subpart C, Section 15.247(b)(1), for Maximum Peak Output Power was carried out.

The Spectrum Analyser was tuned to the test frequency. The device Output power setting was controlled via the 'Test Mode' on each handset being set to the conditions specified in the Summary on page 5 of this document. The device was then rotated through 360 degrees until the highest power level was observed in both planes of polarisation. The device was then replaced with a substitution antenna, the signal to the antenna was adjusted to equal the related level detected from the device.

Maximum Peak Output Power measurements were made with the EUT set to continuous transmit at maximum power on the following channels:

- Channel 1: 2412MHz
- Channel 6: 2347MHz
- Channel 11: 2462MHz

**TEST RESULTS**

The EUT met the requirements of FCC Part 15.247(b)(1) for Maximum Peak Output Power, see Table 1.

**MAXIMUM POWER**

Frequency (MHz)	Raw Result (dBm)	Substitution Level (dBm)	Cable Loss (dB)	Substitution Antenna Gain (dB)	Result ERP (dBm)	Result ERP (mW)

Calculations: The figures in Watts in the above table were calculated using the formula:

$$\text{EIRP in Watts} = \frac{10^{\left(\frac{\text{dBm}}{10}\right)}}{1000}$$

**Re: Measurement facility located at Titchfield  
Anechoic chamber (3 meters) and 3 & 10 meter OATS  
Date of Listing: October 18, 2002**

**Gentlemen:**

Your request for registration of the subject measurement facility has been reviewed and found to be in compliance with the requirements of Section 2.948 of the FCC rules. The information has, therefore, been placed on file and the name of your organization added to the list of facilities whose measurement data will be accepted in conjunction with applications for Certification under Parts 15 or 18 of the Commission's Rules. Please note that the file must be updated for any changes made to the facility and the registration must be renewed at least every three years.

Measurement facilities that have indicated that they are available to the public to perform measurement services on a fee basis may be found on the FCC website [www.fcc.gov](http://www.fcc.gov) under E-Filing, OET Equipment Authorization Electronic Filing, Test Firms.

Sincerely,

**Thomas W Phillips  
Electronics Engineer**

## **MEASUREMENT UNCERTAINTY**

For a 95% confidence level, the measurement uncertainties for defined systems, are :-

In the frequency range 30MHz to 1000MHz

For Radiated Emissions, Quasi-Peak Measurements taken in Zero Span using the Hewlett Packard EMI Receiver:-

Frequency	$\pm 2 \times 10^{-7}$ x Centre Frequency
Amplitude	+4.45dB (30-200MHz; 3m Measurements) -4.42dB (30-200MHz; 3m Measurements) +4.80dB (200-1000MHz; 3m Measurements) -3.81dB (200-1000MHz; 3m Measurements)

In the frequency range 1GHz to 25GHz

For Radiated Emissions measurements:-

Frequency	$\pm 2 \times 10^{-7}$ x Centre Frequency
Amplitude	$\pm 3.0$ dB (1-25GHz; 3m Measurements)

For Effective Radiated Power (ERP) measurements:-

Amplitude	$\pm 1.45$ dBm
