INTERNATIONAL APPROVALS LABORATORIES (IAL) reports apply only to the specific samples tested under stated test conditions. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. IAL have no liability for any deductions, inferences or generalizations drawn by the client or others from IAL issued reports.

This report is the confidential property of the client. As a mutual protection to our clients, the public and ourselves, extracts from the test report shall not be reproduced except in full without our written approval of IAL. This report shall not be used by the client to claim product endorsement by NVLAP (No. 200624-0) or any agency of the US government.

International Approval Laboratories and its professional staff hold government and professional organization certifications and are members of IEEE, NVLAP, and VCCI.

### STATEMENT OF MEASUREMENT UNCERTAINTY

The data and results referenced in this document are true and accurate. The measurement uncertainty for Conducted Emissions in the frequency range of 150 kHz - 30 MHz is calculated to be  $\pm 2.30 \text{dB}$  and for Radiated Emissions is calculated to be  $\pm 3.60 \text{dB}$  in the frequency range of 30 MHz - 200 MHz and  $\pm 3.38 \text{dB}$  in the frequency range of 200 MHz - 1000 MHz.

EUT Received Date: 3-June-2004

Testing Start Date: \_3-June-2004

Testing End Date: 6-July-2004

### The tests were performed according to following regulations:

- 1. FCC CFR47 Part 15.205
- 2. FCC CFR47 Part 15.207
- 3. FCC CFR47 Part 15.209
- 4. FCC CFR47 Part 15.247
- 5. ICES-003

### **Emission Test Results:**

Conducted Emissions, Powerline (15.2	07) - Not Applicable	
Test Result		
Minimum limit margin	<u>NA</u> dB at <u>NA</u> MHz	
Maximum limit exceeding	dB atMHz	
Remarks:		
Radiated Emissions (15.209) - PA	SS	
Test Result		
Minimum limit margin	<u>-13.5</u> dB at <u>204.18</u> MHz	
Maximum limit exceeding	dB atMHz	
Remarks:		
Radiated Emissions (15.205)/(15.247) (	c) - PASS	
Test Result		
Minimum limit margin	8.58_ dB	
Maximum limit exceeding	dB atMHz	
Remarks:		
Peak Output Power (15.247) (b)(2) -	PASS	
Test Result		
Minimum limit margin	<u>-15.28</u> dB at <u>912.59</u> MHz	
Maximum limit exceeding	dB atMHz	
Remarks:		

#### GENERAL REMARKS:

The following remarks are to be considered as "where applicable" and are taken into account while completing any FCC/IC/ETSI radio tests at International Approvals Laboratories, LLC.

Testing was performed in 3 different orthogonal axis to determine the worst case emissions from the device. The worst case emissions measurements are shown in this report.

FCC CFR47 Part 15.31: Measurement Standards: In any case where the device is powered off a battery, a fresh battery was used during test. In cases where the device is powered off an AC supply, voltage was varied per Part 15.31 to find worst case emissions.

FCC CFR47 Part 15.35: Measurement Detector Functions and Bandwidths: FCC Part 15.35 was utilized when performing the measurements within this report.

In any case where the device is powered off a battery, a fresh battery was used during test. In cases where the device is powered off an AC supply, voltage was verified per Part 15.31 to find worst case emissions.

The actual test distance for the FCC Part 15.209 testing was conducted at 10m for the fact that the device was being tested to EN55022 Class B from 30 MHz to 1000 MHz (meets/exceeds the FCC Part 15.209 & 109B limits) The data is automatically extrapolated back to the FCC 3m limits and measurements are corrected to better show the compliance to FCC requirements and reduce confusion. A correction factor of 10.54dB is used in cases of 30MHz and up for a difference between 10m and 3m measurement distances. All measurements that are lesser than 30MHz where applicable are accompanied with the fall of measurements and calculations to support the interpolation.

Client requested that the name on the test report be changed from FA575 to SSRL November 2004.

Modifications required to pass:	
Test Specification Deviations: A	Additions to or Exclusions from

This test report is in-part, International Approvals Laboratories, LLC was asked to test only the field strength of the fundamental and harmonics as well as the unintentional radiated and conducted emissions when applicable.

Todd Seeley IA Labs 5451 Central Ave. Boulder, CO 80301

#### Dear Todd,

Pursuant to section 15.247 of the FCC rules Inovonics transmitters are limited to 0.25 Watts maximum transmitted power. These devices contain integrated antennas and it is therefore impossible to measure the transmitted power in a conducted manner without significantly modifying the devices.

At the test lab the field strength is measured using an antenna located 3 meters from the device under test. The rules do not explicitly state the field strength at 3 meters corresponding to 0.25 Watts, so it must be calculated as follows:

The test facility measures the transmitted field strength, E, having units of Volts/meter, or the logarithmic equivalent. The transmitted power density as measured by the antenna is then  $\frac{E^2}{\eta}$ , where  $\eta$  is the intrinsic impedance of free space.

Assuming isotropic radiation from the product, the Effective Isotropic Radiated Power (EIRP) is found by multiplying the above power density by the area of a sphere having a radius of 3 meters,

$$P_{HRP} = \frac{E^2}{\eta} 4\pi R^2 \qquad (1)$$

Solving for E,

$$E = \frac{1}{2R} \left( \frac{\eta P_{IJRP}}{\pi} \right)^{\frac{N}{2}}$$
 (2)

Given that  $P_{\text{EIRP}}=0.25$  Watts (FCC limit), R=3 meters, and  $\eta=377$  Ohms, E=0.913 V/m = 119.2 dB  $\mu$ V/m.

Remember the above assumption of isotropic radiation- all real antennas have non-isotropic radiation patterns. Using the 119.2 dB  $\mu$ V/m limit guarantees that the total RF power transmitted by the device is below the 0.25 Watt limit.

Also, according the part 15.35 we are allowed a relaxation of the general radiation limits found in 15.209 while using a peak detector, as applied to the harmonics of the fundamental. Inovonics EchoStream security transmitters have a transmission pulse duration of 20 ms, which corresponds to a duty cycle of 0.2 per 15.35(c). This duty cycle allows for a 14 dB relaxation of the general radiation limits from 54 dB  $\mu\text{V/m}$  (500  $\mu\text{V/m}$ , per 15.209(a) ) to 68 dB  $\mu\text{V/m}$  for peak measurements.

Sincerely

Steven Dunbar RF Engineer

Measurement Protocol
And
Test Procedures

#### MEASUREMENT PROTOCOL

#### **GENERAL INFORMATION**

### **Test Methodology**

Conducted and radiated emission testing is performed according to the procedures in ANSI C63.4 & CNS13438.

### **Justification**

The Equipment Under Test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral into it's characteristic impedance or left unterminated. When appropriate, the cables are manually manipulated with respect to each other to obtain maximum emissions from the unit.

#### **CONDUCTED EMISSIONS**

The final level, expressed in  $dB\mu V$ , is arrived at by taking the reading directly from the EMI receiver. This level is compared directly to the applicable limit.

To convert between  $dB \mu V$  and  $\mu V$ , the following conversions apply:

- $dB\mu V = 20(log \mu V)$
- $\mu V = Inverse \log(dB\mu V/20)$

#### RADIATED EMISSIONS

The final level, expressed in  $dB\mu V/m$ , is arrived at by taking the reading from the spectrum analyzer (Level  $dB\mu V$ ) and adding the antenna correction factor and cable loss factor (Factor dB) to it. This result then has the applicable limit subtracted from it to provide the Delta which gives the tabular data as shown in the data sheets in Attachment B. The amplifier gain is automatically accounted for by using an analyzer offset.

Example: At a Test Frequency of 30 MHz, with a peak reading on the spectrum analyzer or measuring receiver of 14 dB mV:

Measured Level	+	Transducer & Cable Loss factor	=	Corrected Reading	Specification Limit	_	Corrected Reading	=	Delta Specification
(dBµV)		(dB)		(dBµV/m)	(dBµV/m)		(dBμV/m)		
14.0		14.9		28.9	40.0		28.9		-11.1

#### **DETAILS OF TEST PROCEDURES**

#### General Standard Information

The test methods used comply with ANSI C63.4-1992 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz."

#### **Conducted Emissions**

Conducted emissions on the 50 Hz and/or 60 Hz power interface of the EUT are measured in the frequency range of 150 kHz to 30 MHz. The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasi-peak detection, and a Line Impedance Stabilization Network (LISN), with 50  $\Omega$ /50  $\mu$ H (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimeters above the floor and is positioned 40 centimeters from the vertical ground plane (wall) of the screen room. In some cases, a pre-scan using a spectrum analyzer is initially performed on the units comprising the system under test to locate the highest emissions. If the minimum passing margin appears to be less than 20 dB with a peak mode measurement, the emissions are re-measured using a tuned receiver or spectrum analyzer with quasi-peak and average detection and recorded on the data sheets.

#### **Radiated Emissions**

Radiated emissions from the EUT are measured in the frequency range of 30 to 22GHz using a spectrum analyzer and appropriate broadband linearly polarized antennas. Measurements between 30 MHz and 1000 MHz are made with 120 kHz/6 dB bandwidth and quasi-peak detection and measurements above 1000 MHz are made with a 1 MHz/6 dB bandwidth and peak detection. Table top equipment is placed on a 1.0 X 1.5 meter non-conducting table 80 centimeters above the ground plane. Floor standing equipment is placed directly on the turntable/ground plane. Interface cables that are closer than 40 centimeters to the ground plane are bundled in the center in a serpentine fashion so they are at least 40 centimeters from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screen room located outside the test area. The antenna is positioned 3, 10 or 30 meters horizontally from the EUT. To locate maximum emissions from the test sample the antenna is varied in height from 1 to 4 meters, measurement scans are made with both horizontal and vertical antenna polarizations and the EUT are rotated 360 degrees.
