RF Exposure measurement

4/1/04, Steve Koster.

The Hand Held Products TT8870-352 Radio Card was tested to show compliance with the RF Exposure requirements. The antenna was placed on a non-conductive support and measurements were taken at 20 cm around the antenna.

The worst case measurement was 0.015 mW/cm^2 .

This is under the general exposure limit of 1 mW/cm^2 and therefore complies with the requirement. The measurement was taken with the Wandel & Golterman e-field probe. The probe calibration is due 8/27/04.

See below for test setup photographs.
