1.3 Details of applicant

Name	:	Matsushita Electric Works, Ltd.
Street	:	1048 Oaza Kadoma, Kadoma-shi
City / Zip Code	:	Osaka-fu 571-8686
Country	:	Japan
Contact	:	Iwao Oyaizu
Telephone	:	+81-59-228-9312
Tele-fax	:	+81-59-224-5926
e-mail	:	ioyaizu@tsu.mew.co.jp

1.4 Application details

Date of receipt of application	:	2002-11-18
Date of receipt test item	:	2002-11-18
Date of test	:	2002-12-02

1.5 Test item

Manufacturer	:	Matsushita Electric Works, Ltd. and/or Shintom co,Ltd.
Country	:	Japan
Model No.	:	ECG2111
Serial No.(ESN)	:	17408810927
Description	:	Emergency Portable Cellular Telephone
FCC-ID	:	HHV20021106

Additional information

Frequency	:	824MHz – 849MHz
Type of modulation	:	AMPS
Antenna	:	Integral
Power supply	:	Battery
Output power	:	600mWatts

1.6 Test standards

FCC Part 22 / RSS118

Note: All radiated measurements were made in all three orthogonal planes. The values reported are the maximum values.

2 Technical test**2.1 Summary of test results**

No deviations from the technical specification(s) were ascertained in the course of the tests Performed	
Final Verdict: (only “passed” if all single measurements are “passed”)	Passed

2.2 Test report

TEST REPORT

Test report no.: EMC_379_FCC_22_2002

TEST REPORT REFERENCE

PARAMETER TO BE MEASURED	PARAGRAPH	PAGE
EFFECTIVE RADIATED POWER LIMITS	§22.913	7
EMISSION LIMITS TRANSMITTER	§2.1053 / §22.917.....	10

EFFECTIVE RADIATED POWER LIMITS**§22.913****EIRP / ERP Measurements**

Description: This is the test for the maximum radiated power from the EUT.

Rule Part 22.913(a) specifies that "The ERP of mobile transmitters must not exceed 7 Watts".

Method of Measurement:

1. In an anechoic antenna test chamber, a half-wave dipole antenna for the frequency band of interest is placed at the reference centre of the chamber. An RF Signal source for the frequency band of interest is connected to the dipole with a cable that has been constructed to not interfere with the radiation pattern of the antenna. A known (measured) power (P_{in}) is applied to the input of the dipole, and the power received (P_r) at the chamber's probe antenna is recorded.
2. A "reference path loss" is established as $P_{in} + 2.1 - P_r$.
3. The EUT is substituted for the dipole at the reference centre of the chamber and a scan is performed to obtain the radiation pattern.
4. From the radiation pattern, the co-ordinates where the maximum antenna gain occurs is identified.
5. "Gated mode" power measurements are performed with the receiving antenna placed at the coordinates determined in Step 3 to determine the output power as defined in FCC Rule 22.913. The "reference path loss" from Step 1 is added to this result.
7. This value is EIRP since the measurement is calibrated using a half-wave dipole antenna of known gain (2.1 dBi) and known input power (P_{in}).

RESULTS OF RADIATED TESTS:

Low channel 991 EIRP 27.31dBm

Mid channel 383 EIRP 27.12dBm

High channel 799 EIRP 26.86dBm

EMISSION LIMITS TRANSMITTER**§2.1053 / §22.917****Measurement Procedure:**

The following steps outline the procedure used to measure the radiated emissions from the EUT. The site is constructed in accordance with ANSI C63.4 – 1992 requirements and is recognised by the FCC. The spectrum was scanned from 30 MHz to the 10th harmonic of the highest frequency generated within the equipment. The resolution bandwidth is set as outlined in Part 22.917. The spectrum was scanned with the mobile station transmitting at carrier frequencies that pertain to low, mid and high channels of the AMPS band.

The final Radiated emission test procedure is as follows:

- a) The test item was placed on a 0.8 meter high non-conductive stand at a 3 meter test distance from the receive antenna.
- b) A double ridged waveguide antenna was placed on an adjustable height antenna mast 3 meters from the test item for emission measurements.
- c) Detected emissions were maximized at each frequency by rotating the test item and adjusting the receive antenna height and polarization. The maximum meter reading was recorded. The radiated emission measurements of all non-harmonic and harmonics of the transmit frequency through the 10th harmonic were measured with peak detector and 1MHz bandwidth. If the harmonic could not be detected above the noise floor, the ambient level was recorded. The equivalent power into a dipole antenna was determined by the substitution method described for ERP measurements.

Measurement Limit:

Sec. 22.917 Emission Limits.

- (a) *Out of band emissions.* The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

- (b) *Measurement procedure.* Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kHz or greater. In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (*i.e.* 100 kHz of 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power

Measurement Results:

Radiated emissions measurements were made only at the upper, middle, and lower carrier frequencies of the AMPS band. The equipment must still, however, meet emissions requirements with the carrier at all frequencies over which it is capable of operating and it is the manufacturer's responsibility to verify this.

RESULTS OF RADIATED TESTS:

Harmonics	Tx ch-991 Freq. (MHz)	Level (dBm)	Tx ch-383 Freq. (MHz)	Level (dBm)	Tx ch-799 Freq. (MHz)	Level (dBm)
