**Exhibit J: Spurious Radiated Emissions** 

FCC ID: HN2MG18

#### Justification

The individuals and/or the organization requesting the test provided the modes, configurations and settings available to evaluate. While scanning the radiated emissions, all of the EUT parameters listed below were investigated. This includes, but may not be limited to, antennas, tuned transmit frequency ranges, operating modes, and data rates.

Channels in Specified Band Investigated:
High
Mid
Low
Operating Modes Investigated:

Typical

Antennas Investigated: Integral to EUT

Data Rates Investigated: Maximum

Output Power Setting(s) Investigated: Maximum

Power Input Settings Investigated:

120 VAC, 60 Hz.

Frequency Range Investigated										
Start Frequency	30 MHz	Stop Frequency	21.25 GHz							

Software\Firmware A	Applied During Test		
Exercise software	Intermec Core	Version	1.8.4
Description			
(C)ommon (O)bject (R)esc used to place calls to the b Microsoft Windows CE Ver	ource (E)nvironment, runnir pase station simulator (HP8 rsion 3.0.9348	ng the D15 GSM Module. T 922 test set). The software	he "Phone App" was e ran on the EUT under

#### **Equipment Modifications**

No EMI suppression devices were added or modified. The EUT was tested as delivered.

# EUT and Peripherals

Description	Manufacturer	Model/Part Number	Serial Number
EUT	Intermec Corporation	700 GPRS	6007998
AC Adapter	Ault Inc.	PW160	None

### Cables

Cable Type	Shield	Length (m)	Ferrite	Connection 1	Connection 2
AC Power	No	2.0	No	AC Adapter	AC Mains
DC Power	PA	1.5	Yes	EUT	AC Adapter
<b>BA = Cable is parm</b>	anonthy attac	had to the device	Shielding on	d/or processo of forrite	may be unknown

PA = Cable is permanently attached to the device. Shielding and/or presence of ferrite may be unknown.

#### Measurement Equipment

#### **Test Description**

Requirement: Per 2.1053 and 24.238, the Field Strength of Spurious Radiation was measured in the farfield at an FCC Listed semi-anechoic chamber up to 21.25 GHz. Spectrum analyzer, signal generator, and linearly polarized antennas were used to measure radiated harmonics and spurious emissions. The orientation of the EUT and measurement antenna were manipulated to maximize the level of emissions. The EUT was configured to transmit at the highest output into its integral antenna at low, mid, and high channels.

The substitution method as described in TIA/EIA-603 Section 2.2.12 was used for the highest spurious emissions. Preliminary measurements were made using the alternate limit of 84.3 dBuV/m at a 3 meter test distance and 93.8 dBuV/m at a 1 meter distance.

Test Methodology: For licensed transmitters, the FCC references TIA/EIA-603 as the measurement procedure standard. TIA/EIA-603 Section 2.2.12 describes a method for measuring radiated spurious emissions that utilizes an antenna substitution method:

At an approved test site, the transmitter is place on a remotely controlled turntable, and the measurement antenna is placed 3 meters from the transmitter. The turntable azimuth is varied to maximize the level of spurious emissions. The height of the measurement antenna is also varied from 1 to 4 meters. The amplitude and frequency of the highest emissions are noted. The transmitter is then replaced with a  $\frac{1}{2}$ wave dipole that is successively tuned to each of the highest spurious emissions. A signal generator is connected to the dipole (horn antenna for frequencies above 1 GHz), and its output is adjusted to match the level previously noted for each frequency. The output of the signal generator is recorded, and by factoring in the cable loss to the dipole antenna and its gain; the power (dBm) into an ideal <sup>1</sup>/<sub>2</sub> wave dipole antenna is determined for each radiated spurious emission.

For the purposes of preliminary measurements, the field strength of the spurious emissions can be measured and compared with a 3 meter limit. The final measurements must be made utilizing the substitution method described above. The 3 meter limit was calculated to be 84.3 dBuV/m at 3 meters. This was based upon an output power of 1 W.

Bandwidths Used for	or Measurements
---------------------	-----------------

Frequency Range (MHz)	Peak Data (kHz)	Quasi-Peak Data (kHz)	Average Data (kHz)
0.01 – 0.15	1.0	0.2	0.2
0.15 – 30.0	10.0	9.0	9.0
30.0 – 1000	100.0	120.0	120.0
Above 1000	1000.0	N/A	1000.0
Massuramonts wara n	ado using the bandwidths	and datactors spacified No.	vidoo filtor was usod

e made using the bandwidths and detectors specified. No video filter was used.
