- Semi anechoic chamber..... (Tsukuba No.3 AC/---/Tokin/SA029/13 July.'08/ July.'09)

The measurement instrumentation used, are calibrated according to Quality Manual.

6.1.2 Measurement Procedure

The power line conducted interference measurements were performed according to ANSI C63.4-2003 (In-house Test Procedure: FCC Part 15 Test Procedure / Document No. IS-QR-030 / Revision No. 2-3) at Semi anechoic chamber No.3.

The EUT placed on a non-conductive table such that it is 0.8m above the horizontal ground reference plane. The rear of the EUT separated from the vertical ground reference plane at 0.4m. Mains cable is longer than 1.0m, the excess folded at the centre into a bundle no longer than 0.4m. The EUT separated from any other ground plane at least 0.8m. There were no deviations from the standard. The standard limit was adopted CISPR 22:1997 Class B.

The EUT was plugged into the LISN and the frequency range of interest scanned.

Reported are maximized emission levels.

These tests were performed at 9kHz of 6dB bandwidth.

Test results were obtained from following equation.

$$\text{Result (dB}\mu\text{V)} = \text{Level (dB}\mu\text{V)} + \text{Total Factor (dB)}$$

6.1.3 Deviation from the specification: None

6.1.4 Measurement Uncertainty

Measurement uncertainty is +/-3.67dB(k=2).

6.2.2 Measurement Procedure

<0.009MHz to 30MHz>

Final test was performed according to ANSI C63.4-2003 at the Semi anechoic chamber No.1. There were no deviations from the standard.

The EUT was placed along with the peripherals. The turntable was separated from the antenna distance 10 meter. Cables were placed in a position to produce maximum emissions as determined by experimentation, and operation mode was selected for maximum.

The frequencies and amplitudes of maximum emission were measured at varying azimuths, antenna polarities. Reported are maximized emission levels.

These tests were performed at the following condition.

<0.009MHz to 150kHz>

These tests were performed at 200Hz of 6dB bandwidth.

Test results were obtained from following equation.

$$\text{Result (dB}\mu\text{V/m)} = \text{Level (dB}\mu\text{V)} + \text{Ant. Factor (dB/m)} + \text{Cable Loss (dB)}$$

<150kHz to 30MHz>

These tests were performed at 9kHz of 6dB bandwidth.

Test results were obtained from following equation.

$$\text{Result (dB}\mu\text{V/m)} = \text{Level (dB}\mu\text{V)} + \text{Ant. Factor (dB/m)} + \text{Cable Loss (dB)}$$

<30MHz to 1000MHz>

Final test was performed according to ANSI C63.4-2003 (In-house Test Procedure : FCC Part 15 Test Procedure / Document No. IS-QR-030 / Revision No.2-3) at semi anechoic chamber No.2. There were no deviations from the standard. The standard limit was adopted CISPR 22:1997 Class B.

The EUT placed upon a non-conductive table 0.8m above the horizontal ground reference plane.

The turntable was separated from the antenna distance 10 meter. Cables were placed in a position to produce maximum emissions as determined by experimentation, and operation mode was selected for maximum.

The frequencies and amplitudes of maximum emission were measured at varying azimuths, antenna polarities. Reported are maximized emission levels.

These tests were performed at 120kHz of 6dB bandwidth.

Test results were obtained from following equation.

$$\text{Result (dB}\mu\text{V/m)} = \text{Level (dB}\mu\text{V)} + \text{Ant. Factor (dB/m)} + \text{Cable Loss (dB)} - \text{Amp. Gain (dB)}$$

6.2.3 Deviation from the specification: None

6.2.4 Measurement Uncertainty

Measurement uncertainty of 0.009MHz to 30MHz is +/-4.04dB(k=2), 30MHz to 300MHz is +/-4.04dB(k=2), 300MHz to 1000MHz is +/-3.88dB(k=2).

(PTK-840/KP-501E)

RFI Field Strength Emission Level

Normal operation mode: 112.00 MHz, 4.3 dB
(PTK-840/KP-501E)

6.4 Calculation of Measurement of RFI Field Strength Emission

Table 6.4-1 Calculation of Measurement of RFI Field Strength Emission

Test results of measurement of RFI Field Strength Emission use the following calculation.

<0.009MHz to 30MHz>

$E = V + AF + CL$

E: Radiated Emission Level (dBμV/m)
V: Field Strength Meter Reading (dBμV)
AF: Antenna Factor (dB/m)
CL: Cable Loss (dB)

<30MHz to 1000MHz>

$E = V + AF + CL - AG$

E: Radiated Emission Level (dBμV/m)
V: Field Strength Meter Reading (dBμV)
AF: Antenna Factor (dB/m)
CL: Cable Loss (dB)
AG: Amplifier Gain (dB)
