

MPE Calculation (for Mobile Device)

FCC ID: HXICS530W

Typical use distance: $d \geq 20$ cm

Power density limit for mobile devices at 2.4 and 5 GHz: $S \leq 1$ mW/cm²

Remark: Average \leq Peak, which means that calculating the power density applying Peak power is worst case. The worst case operation mode generating the highest power in each frequency range is taken for calculation.

Frequency range: 2412-2462MHz; 2422-2452MHz;

Maximum measured conducted power (Average): $P_{\text{conducted}} = 10.68$ dBm

Antenna Gain: $G = 3$ dBi

Calculation: $P_{\text{radiated}} = P_{\text{conducted}} + G_{\text{linear}} = 10.68 \text{ dBm} + 3 \text{ dBi} = 13.68 \text{ dBm} = 23.33 \text{ mW}$

Power density $S = (P_{\text{radiated}}) / (4\pi \times d^2) = 23.33 / 5026 = 0.0047 \text{ mW/cm}^2$ which is far below the limit, so pass.
