### **2.2 Product description**

Model No: 23AAY (referred to as the EUT in this report) is the Remote Keyless Entry System and TPMS (Receiver). 23AAY has 15 variations. For details of variations, see "Theory of Operation".

Feature of EUT:

<RKES mode>

RKE System is mainly used for locking or unlocking the doors of the vehicle. The transmitter sends a radio wave signal, while the button is pushed. The receiver becomes active in response to the signal from the transmitter.

<TPMS mode>

Tire Pressure Monitoring System is used for monitoring and indicating information of air pressure in vehicle's tires. Transmitter sends receiver the data that informs air pressure in vehicle's tire to the receiver. The data also includes the information of temperature, battery voltage and identity code of transmitter. The receiver judges the data, and if the data of air pressure and others is not in a normal condition, the receiver sends signal to a warning lamp. Then, the warning lamp warns drivers.

Type of receiving system : Super-heterodyne  
Frequency of Operation : RKES (CH1): 314.35 MHz  
RKES (CH2): 312.10 MHz  
TPMS: 314.98 MHz  
Oscillator Frequency : 25.2 MHz (Crystal)  
Type of Modulation : RKES: FSK (F1D)  
TPMS: FSK (F1D)  
Power Supply : DC 12.0 V  
Antenna Type : ANT1: Internal antenna (Inverse F antenna / Inverse L antenna)  
ANT2: External antenna (Connector)

## **SECTION 4: Operation of E.U.T. during testing**

### **4.1 Operating modes**

The mode used:

1. RKES Receiving mode (314.35 MHz)
2. RKES Receiving mode (312.10 MHz)
3. TPMS Receiving mode (314.98 MHz)

\* Refer to the table in “Theory of Operation\_Variation\_23AAY” for test mode.

Regarding RKES Receiving mode (314.35 MHz / 312.10 MHz), internal antenna receiving was tested with Variation No. 2, because Variation No. 2 had the highest emission level compared to the other representative variants (Variation No. 2, 3, 5, 8, 11 and 14) of the table in “Theory of Operation”.

Regarding TPMS Receiving mode (314.98 MHz), internal antenna receiving was tested with Variation No. 2 which was the worst-variation of RKES Receiving mode.

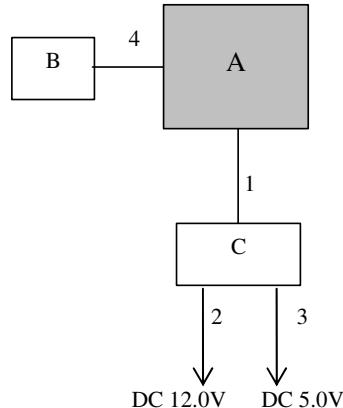

Also, external antenna receiving (Test mode 1, 2, 3) was tested with Variation No. 3 as representative, because there was no difference in circuit construction by variations.

Among Variation No.1 to 15,

- the difference due to the feeding point and antenna variation of the internal antenna was confirmed with Variation No. 2, 3, 5, 8, 11, and 14.
- regarding External antenna, variants with External antenna were tested, which were the worst condition for EMI.

As a result, enough margin for the limit was observed.

### **4.2 Configuration and peripherals**

\*Cabling and setup were taken into consideration and test data was taken under worse case conditions.

TYPE1 which was used for the tests has 306 "Nothing" and 307 "Nothing".

The result of Radiated emission test was mainly from characteristics of Local Oscillator.

If the range of 306, 307, 308 and 309 becomes "Capacitor 0.1 - 1000pF", or "Inductor 1 - 100nH", there is no influence on the result of Radiated emission test.

## **SECTION 5: Radiated Emission**

## 5.1 Operating environment

Test place : No. 4 semi anechoic chamber  
Temperature : See data  
Humidity : See data

## 5.2 Test configuration

EUT was placed on a urethane platform of nominal size, 1.0 m by 1.5 m, raised 0.8 m above the conducting ground plane.

The EUT was set on the edge of the tabletop.

Test was made with the antenna positioned in both the horizontal and vertical planes of polarization. The measurement antenna was varied in height above the conducting ground plane to obtain the maximum signal strength.

Photographs of the set up are shown in Appendix 3.

### 5.3 Test conditions

Frequency range	: 30 MHz - 300 MHz (Biconical antenna) / 300 MHz - 1000 MHz (Logperiodic antenna) 1000 MHz - 2000 MHz (Horn antenna)
Test distance	: 3 m
EUT position	: Table top
EUT operation mode	: See Clause 4.1

## 5.4 Test procedure

The height of the measuring antenna varied between 1 and 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed for both vertical and horizontal antenna polarization with the Test Receiver. The radiated emission measurements were made with the following detector function of the Test Receiver.

Frequency	Below 1 GHz	Above 1 GHz
Instrument used	Test Receiver	Test Receiver
IF Bandwidth	QP: BW 120 kHz	PK: BW 1 MHz, CISPR AV: BW 1 MHz

- The noise levels were confirmed at each position of X, Y and Z axes of EUT to see the position of maximum noise, and the test was made at the position that has the maximum noise.

The expiration date of the calibration is the end of the expired month.

All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.
