SECTION 2: Equipment under test (E.U.T.)

2.1 Identification of E.U.T.

Type of Equipment	:	Millimeter Wave Radar Sensor
Model No.	:	DNMWR009
Serial No.	:	Refer to Section 4, Clause 4.2
Rating	:	DC 12 V (Car battery), DC 8 V to 16 V(Operating range)
Receipt Date of Sample	:	July 4, 2016
Country of Mass-production	:	Japan
Condition of EUT	:	Engineering prototype (Not for Sale: This sample is equivalent to mass-produced items.)
Modification of EUT	:	No Modification by the test lab

2.2 Product Description

Model No: DNMWR009 (referred to as the EUT in this report) is the 76 GHz - 77 GHz vehicle-mounted field disturbance sensor that is a millimeter wave frequency modulated (FM-CW and FCM) radar operating at 76.5 GHz.
FM-CW: Frequency Modulated Continuous Wave
FCM: Fast Chirp Modulation

General Specification

Clock frequency(ies) in the system	:	40 MHz

Radio Specification

Radio Type	:	Transceiver
Frequency of Operation	:	76.5 GHz
Modulation	:	Frequency modulation (FM-CW, FCM)
Antenna Type	:	Microstrip array antenna
Antenna Connector	:	None (Internal Antenna)
Antenna Gain	:	Tx_N (FM-CW): 16.2 dBi Tx_W (FCM): 13.8 dBi
Steerable Antenna	:	Electronically (Receiving Part only)
Usage location	:	Vehicle-mounted
Power Supply (inner)	:	DC 3.3 V, DC 5 V

SECTION 3: Test specification, procedures & results

3.1 Test Specification

Test Specification	:	FCC Part 15 Subpart C FCC part 15 final revised on April 6, 2016.
Title	:	FCC 47CFR Part 15 Radio Frequency Device Subpart C Intentional Radiators Section 15.253 Operation within the bands 46.7-46.9 GHz and 76.0-77.0 GHz.

Note: UL Japan, Inc.'s EMI Work Procedures No. 13-EM-W0420 and 13-EM-W0422.
*1) The test is not applicable since the EUT is not the device that is designed to be connected to the public utility (AC) power line

FCC Part 15.31 (e)
The EUT provides stable voltage (DC 3.3 V, DC 5 V) constantly to RF Part regardless of input voltage.
Instead of a new battery, DC power supply was used for the test. That does not affect the test result, therefore the EUT complies with the requirement. As for the Frequency Stability, the test was performed based on 15.253 (f).

FCC Part 15.203 Antenna requirement
It is impossible for end users to replace the antenna, because the antenna is mounted inside of the EUT. Therefore, the equipment complies with the antenna requirement of Section 15.203.

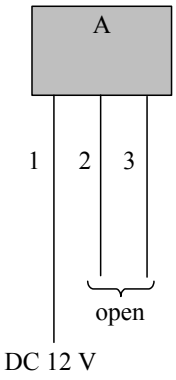
SECTION 4: Operation of E.U.T. during testing

4.1 Operating Mode(s)

Mode	Test Item
Normal operating mode (FM-CW + FCM)	20 dB and 99 % Bandwidth Spurious Emission Frequency Stability
Test mode (FM-CW), Test mode (FCM)	Power Density
In actual operation, there are FM-CW and FCM modulation parts in one transmission burst. First, the EUT transmits FM-CW modulation. After that, FCM transmission starts immediately. These two modulations do not transmit at the same time. These modulations have individual transmit antennas. (Switching antenna Tx_N: FM-CW and Tx_W: FCM alternately.) The test modes (FM-CW only, FCM only) were used for the purpose of power measurement. Power of the EUT was set by the software as follows; Power settings: Same as production model Software: mwr_gen5_0041_t717.s This setting of software is the worst case. Any conditions under the normal use do not exceed the condition of setting. In addition, end users cannot change the settings of the output power of the product.	

4.2 Configuration and peripherals



* Cabling and setup were taken into consideration and test data was taken under worse case conditions.

SECTION 5: Radiated Emission (Spurious Emission, Power Density)

Test Procedure

[For below 1 GHz]
EUT was placed on a urethane platform of nominal size, 0.5 m by 1.0 m, raised 0.8 m above the conducting ground plane. The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with a ground plane.

[For above 1 GHz, up to 40 GHz]
EUT was placed on a urethane platform of nominal size, 0.5 m by 0.5 m, raised 1.5 m above the conducting ground plane.
The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with absorbent materials lined on a ground plane.

The height of the measuring antenna varied between 1 m and 4 m (frequency range 9 kHz – 30 MHz: loop antenna was fixed height at 1.0 m) and EUT was rotated a full revolution in order to obtain the maximum value of the electric field strength.
The measurements were performed for both vertical and horizontal antenna polarization with the Test Receiver, or the Spectrum Analyzer.
The measurements were made with the following detector function of the test receiver and the Spectrum analyzer (in linear voltage average mode).
The test was made with the detector (RBW/VBW) in the following table.
When using Spectrum analyzer, the test was made with adjusting span to zero by using peak hold.

Test Antennas are used as below;

Frequency	Below 30 MHz	30 MHz to 200 MHz	200 MHz to 1 GHz	Above 1 GHz
Antenna Type	Loop	Biconical	Logperiodic	Horn

Frequency	9 kHz – 150 kHz	150 kHz – 30 MHz	30 MHz – 1 GHz	1 GHz – 40 GHz

Detector	QP, Average	QP, Average	QP	Peak	Average *1)
IF Bandwidth	BW 200 Hz	BW 9 kHz	BW 120 kHz	RBW: 1 MHz VBW: 3 MHz	RBW: 1 MHz VBW: 10 Hz
Test Distance	3 m	3 m	3 m	4.5 m *2) (1 GHz – 10 GHz) 1 m*3) (10 GHz – 40 GHz)	

*1) Other than pulsed emission, aVBW was set to 10 Hz and linear voltage average mode was used.
*2) Distance Factor: 20 x log (4.5 m / 3.0 m) = 3.5 dB
*3) Distance Factor: 20 x log (1.0 m / 3.0 m) = -9.5 dB

[Above 40 GHz]
The test was performed based on "Procedures for testing millimeter-wave systems" of ANSI C63.10-2013. The EUT was placed on a urethane platform, raised 1.5 m above the conducting ground plane. The measurements were performed on handheld method.

Set spectrum analyzer RBW, VBW, span, etc., to the proper values. Note these values. Enable two traces—one set to "clear write," and the other set to "max hold." Begin hand-held measurements with the test antenna (horn) at a distance of 1 m from the EUT in a horizontally polarized position. Slowly adjust its position, entirely covering the plane 1 m from the EUT. Observation of the two active traces on the spectrum analyzer will allow refined horn positioning at the point(s) of maximum field intensity. Repeat with the horn in a vertically polarized position. If the emission cannot be detected at 1 m, reduce the RBW to increase system sensitivity. Note the value. If the emission still cannot be detected, move the horn closer to the EUT, noting the distance at which a measurement is made.

Note the maximum level indicated on the spectrum analyzer. Adjust this level, if necessary, by the antenna gain, conversion loss of the external mixer and gain of LNA used, at the frequency under investigation. Calculate the field strength of the emission at the measurement distance from the Friis' transmission equation.

Frequency	40 GHz – 50 GHz	50 GHz – 75 GHz	75 GHz – 110 GHz	110 GHz – 170 GHz	170 GHz – 231 GHz
Final measurement distance with 1 MHz Peak detector	0.5 m	0.5 m	0.4 m	0.02 m	0.02 m

[About fundamental measurement]
The carrier levels were confirmed at maximum direction of transmission. The maximum direction was searched under carefully since beam-widths are extremely narrow.

The carrier levels were measured in the far field. The distance of the far field was calculated from follow equation.

$$r = \frac{2D^2}{\lambda}$$

where
r is the distance from the radiating element of the EUT to the edge of the far field, in m
D is the largest dimension of both the radiating element and the test antenna (horn), in m
(The antenna aperture size of test antenna was used for this caluculation.)
Lambda is the wavelength of the emission under investigation [300/f (MHz)], in m

Frequency	Wavelength	Maximum Dimention			Far Field Boundary
		EUT	Test Antenna	Maximum	
	Lambda			*D*	*r*
[GHz]	[mm]	[m]	[m]	[m]	[m]
77	3.9	0.013695	0.026162	0.026162	0.352

The test was made on EUT at the normal use position except for carrier measurement.
For the fundamental frequency measurement, the EUT was placed on the jig because the antenna array was mounted on angularly-tilted.

The test results and limit are rounded off to one decimal place, so some differences might be observed.

Measurement range : 9 kHz - 231 GHz
Test data : APPENDIX
Test result : Pass

SECTION 6: Frequency Stability

Test Procedure
The block downconverter was placed in side of the temperature chamber's drain hole.

The power supply was set to 100 % of nominal voltage, the spectrum mask was measured at 20 deg. C. After that, EUT power supply was varied between 85 % and 115 % of nominal voltage and the frequency excursion of the EUT emission mask was recorded.

The EUT operating temperature was raised to 50 deg. C., the frequency excursion of the EUT emission mask was recorded. Measurements were repeated at each 10 deg. C decrement down to –20 deg. C.

Some measurements were performed at additional temperatures according to operating temperature range of the EUT. (85 deg. C, 70 deg. C, 60 deg. C and -30 deg. C)

Both lower and upper -20 dBc frequencies on the emission mask were recorded.

* The peak density is less than the average limit.
There is no spurious emission from 40 GHz to 231 GHz except for operating band.

The system noise floor was validated according to Section 9.8 of the ANSI C63.10-2013. If required, additional tests were performed with reduced RBW to make sure the measurement results.

***1) This test equipment was used for the tests before the expiration date of the calibration.**

The expiration date of the calibration is the end of the expired month.

[Below 40 GHz]
All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.

[Above 40 GHz]
Acceptance criteria for untraceable equipment was formulated according to ISO/IEC 17025 5.6.2.2.2, and the regular inspection was performed based on it annually.
For 40 GHz - 110 GHz, power sensor is calibrated by manufacturer, and the measured calibration data is used as in-house reference. The calibration data by manufacturer is checked for acceptance by a calorie meter except for some frequency bands.
For above 110 GHz, output level of millimeter wave source module is used as the reference, and inspection by the calorie meter is performed.
Electric power is checked with the calorie meter by measuring resistance and voltage of reference resistor.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.
