

Professional Installation Statement

This letter is submitted with regards to professional installation of the external HZB-AP700 radios using external antennas. The HZB-AP700 products have integral antenna models and external antenna models. The external antenna model must be professionally installed and so is exempt from the antenna restrictions of FCC Part 15.203.

The equipment is designed for point-to-point or point-to-multipoint communications and will carry data signals using Ethernet interfaces. The product versions using external antennas are for fixed indoor or outdoor use. Due to the unique requirements of installation of the systems when using external antennas, typical consumers or businesses will not have the proper training required for successful implementation of these systems.

The HZB-AP700 is not designed for use by the general public, and will be sold as follows:

- Through the Proxim sales force to professional communications users
- Through designated and professionally trained Proxim Value Added Resellers to business users under individual reseller agreements.

The output power of the HZB-AP700 radio will be adjusted to meet any applicable EIRP limits by the professional installer during installation. The method of adjusting the output power is described in the product regulatory manual written for use by professionally trained installers.

The external antenna version of HZB-AP700 radio is typically sold without an antenna, and the customer and/or installation engineer chooses from commercially available antennas in the approved antenna scope. The professional installation engineer is responsible to install only those commercially available antenna(s) (or similar) as listed in the filing. From time to time, Proxim may sell a commercially available antenna as listed in the filing along with the HZB-AP700 radio upon customer request. Only antenna(s) covered in the filing are to be used with the device.

Proxim has also included detailed instructions on how to determine the maximum output power based on EIRP limits for all professional installers to follow.
