Attention: Reviewing Engineer

The HZB-S58-B60C radio is designed for fixed-mount point-to-multipoint applications. The following table lists the RF exposure Power Density for all types and sizes of antennas intended to be used with the device. The power density calculation shows compliance to the limit for General Population/ Uncontrolled environment as specified in rule 1.1310.

Please contact the undersigned for any questions.

SEC-5V/H-60-18	18.0	0.65	0.216	0.1404		60	0.066	1.8803	3.4177	0.0047	0.0108	3.4177	0.0284

Where:

G: antenna gain

h: the height of the antenna

A: physical area of the aperture antenna

P: radio output power, P_{max} = 0.066 W

S_{surface}: maximum power density at the antenna surface, S_{surface} = 4P/A, with omni antenna, S_{surface}=P/(2x3.14xODxh)

R_{nf}: extent of near field, R_{nf} = D²/4λ, where λ is wavelength, at 5.8GHz, λ=0.052m;

With omni antenna, R_{nf} is where S_{nf}=S_{ff}; R_{nf}=Gh/2, where G is the antenna gain

With sector antenna, R_{nf} is where S_{nf}=S_{ff}, R_{nf}=θhG/720

S_{nf max}: maximum near field power density,

For panel and parabolic antennas, S_{nf} = 16ηP/πD² (D is the antenna diameter); for worst case situation, η is assumed to be 1

For omni and sector antenna, S_{nf}=180P/(θπh R_{nf})

R_{ff}: distance to beginning of far field; with omni and sector antenna, R_{ff} starts at the point where S_{nf}=S_{ff}

S_{ff}: far field power density (on axis); S_{ff} = PG/4πR²

Note: Power density beyond 1.5m from the center of antenna must be within 10W/m² or 1mW/cm²
