APPLICATION FOR FCC CERTIFICATION **U-NII Device**

Glenayre Western Multiplex
Model: 27710

FCC ID: HZB-U58/45

Job # J99014962
Report #J99014962d

Number of Pages: 17 pp. + Supporting Data and Documents

Date of Report: June 21, 1999

This report shall not be reproduced except in full, without written approval of Intertek Testing Services.

This report must not be used to claim product endorsement by NVLAP or any agency of the U.S. Government.

The results contained in this report were derived from measurements performed on the identified test samples. Any implied performance of other samples on this report is dependent on the representative of the samples tested.

Glenayre Western Multiplex, U-NII Radio
FCC ID: HZB-U58/45

Date of Test: June 3-10, 1999

2.0 General Description

2.1 Product Description

The Model No.: 27710 is a U-NII Single Band Radio in the frequency range: 5.725-5.825 GHz.

A pre-production version of the sample was received on June 3, 1998 in good condition.

Overview of the product

Applicant	Glenayre Western Multiplex
Trade Name & Model No.	27710
FCC Identifier	HZB-U58/45
Use of Product	Point-to-point fixed wireless interconnect
Manufacturer	Glenayre Western Multiplex
Type of Transmission	QPSK
Rated RF Output (mW)	295 mW
Frequency Range (MHz)	5.725 – 5.825 GHz
Number of Channel(s)	2
Antenna(s) & Gain, dBi	23 dBi
Antenna Requirement	<input type="checkbox"/> The EUT uses a permanently connected antenna. <input type="checkbox"/> The antenna is affixed to the EUT using a unique connector which allows for replacement of a broken antenna, but DOES NOT use a standard antenna jack or electrical connector. <input checked="" type="checkbox"/> The EUT requires professional installation (attach supporting documentation if using this option).
Manufacturer name & address	Glenayre Western Multiplex 1196 Borregas Avenue Sunnyvale, California 94089

2.2 Related Submittal(s) Grants

None.

2.3 Test Methodology

Both AC mains line-conducted and radiated emissions measurements were performed according to the procedures in ANSI C63.4 (1992). Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the "**Data Sheet**" of this Application. All other measurements were made in accordance with the procedures in part 2 of CFR 47.

2.4 Test Facility

The open area test site and conducted measurement facility used to collect the radiated data is site 1. This test facility and site measurement data have been fully placed on file with the FCC and NVLAP accredited.

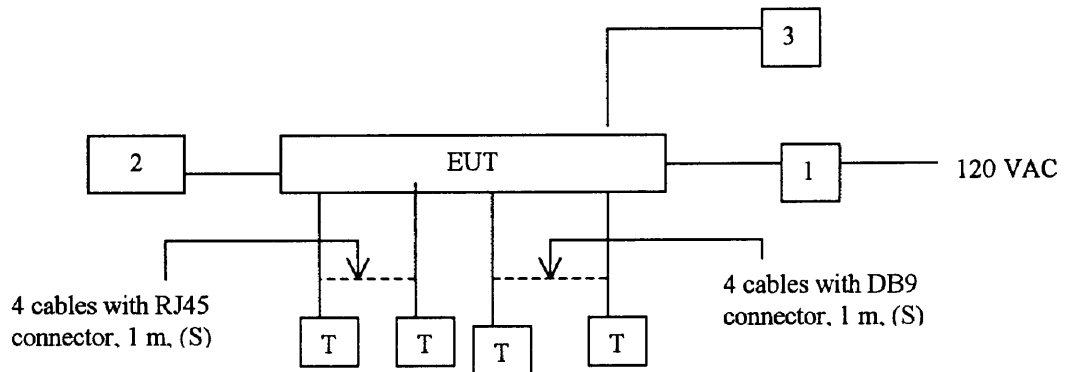

3.0 System Test Configuration

3.1 Support Equipment and description

The FCC ID's for all equipment used in the tested system (included inserted cards, which have grants) are:

Item #	Description	Model No.	Serial No.	FCC ID
1	EXTEH Power Supply	EP-3003	N/A	N/A
2	Telephone	M7100	N/A	N/A
3	Gabriel Antenna	DFP	N/A	N/A

3.2 Block Diagram of Test Setup

* = EUT

** = No ferrites on video cable

S = Shielded,

U = Unshielded

F = With Ferrite

T = Termination

3.3 Justification

For emission testing, the equipment under test (EUT) was configured for testing in a typical fashion (as a customer would normally use it). During testing, all cables were manipulated to produce worst case emissions.

For radiated emission measurements, the EUT is attached to a cardboard box (if necessary) and placed on the wooden turntable. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). The EUT is wired to transmit full power without modulation.

The signal is maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters. Detector function is in peak mode. Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance.

All readings are extrapolated back to the equivalent three meter reading using inverse scaling with distance.

3.4 Software Exercise Program

The EUT exercise program used during radiated and conducted testing was designed to exercise the various system components in a manner similar to a typical use. For emissions testing, the units were setup to transmit continuously to simplify the measurement methodology. Care was taken to ensure proper power supply voltages during testing.

3.5 Mode of Operation during Test

Transmitting signal on low and high frequencies.

3.6 Modifications Required for Compliance

The following modifications were installed during compliance testing in order to bring the product into compliance (Please note that this list does not include changes made specifically by Glenayre Western Multiplex prior to compliance testing):

No modifications were made to the EUT by Intertek Testing Services.

3.7 Additions, deviations and exclusions from standards

No additions, deviations or exclusion have been made from standard.

4.0 Measurement Results

4.1 Maximum Conducted Output Power at Antenna Terminals, FCC Rules 15.407(a):

Requirement:

For fixed point-to-point U-NII devices operating in 5.725-5.825 GHz band, the peak transmit power shall not exceed the lesser of 30 dBm or $17 \text{ dBm} + 10 \text{Log}(B)$ where B is the 26dB emission bandwidth in MHz (for antenna gain up to 23 dBi).

Test Procedure

The antenna port of the EUT was connected to the input of a power meter. Power was read directly and cable loss correction was added to the reading to obtain power at the EUT antenna terminals.

Test Result

Band 5.725-5.825 GHz, Max. antenna gain = 23 dBi			
Frequency (MHz)	Output in dBm	Output in mW	Limit in mW
Low Channel: 5756.0	24.7	295.1	1000
High Channel: 5794.1	23.4	218.8	1000

Cable loss: 0 dB

External Attenuation: 0 dB

Cable loss, external attenuation: is included in OFFSET function

4.2 Minimum 26 dB RF Bandwidth, FCC Rule 15.407(a): (for calculation only)

Test Procedure

The antenna port of the EUT was connected to the input of a spectrum analyzer. Analyzer RES BW was set to 100 kHz. For each RF output channel investigated, the spectrum analyzer center frequency was set to the channel carrier. A PEAK output reading was taken, a DISPLAY line was drawn 26 dB lower than PEAK level. The 26 dB bandwidth was determined from where the channel output spectrum intersected the display line.

Test Result

Frequency (MHz)	26 dB Bandwidth (MHz)
5756.0	40.7
5794.1	40.1

Refer to the following plots for 26 dB bandwidth:

Plot 2c: 5.725-5.825 GHz band, Low Channel, 26 dB RF Bandwidth

4.3 Maximum Power Density, FCC Rule 15.407(a)(3):

Requirement:

For fixed point-to-point U-NII devices operating in 5.725-5.825 GHz band the peak power spectral density shall not exceed 17 dBm in any 1 MHz band for antenna gain up to 23 dBi.

Test Procedure

Antenna output of the EUT was coupled directly to spectrum analyzer; if an external attenuator and/or cable was used, these losses are compensated for with the analyzer OFFSET function.

The spectrum analyzer Resolution and Video Bandwidths were set to 1 MHz. The START and STOP frequencies were set to the band edges of the maximum output passband. The spectrum analyzer was set to video average, 100 sweeps were used. Maximum peak-power spectral density reading was recorded.

Test Result

Frequency (MHz)	Power Density (dBm)	Limit (dBm)
5756.0	8.9	17
5794.1	8.3	17

4.4 Out of Band Conducted Emissions, FCC Rule 15.407(b):

Requirement:

For transmitters operating in the 5.725-5.825 GHz band: all emissions within the frequency range from the band edge to 10 MHz above or below the band edge shall not exceed an EIRP of -17 dBm/MHz: for frequencies 10 MHz or greater above or below the band edge, emissions shall not exceed an EIRP of -27 dBm/MHz.

Test Procedure

The emission measurements shall be performed using a minimum resolution bandwidth of 1 MHz. A lower resolution bandwidth may be employed near the band edge, when necessary, provided the measured energy is integrated to show the total power over 1 MHz.

Test Result

Refer to the following plots for out of band conducted emissions data:

4.5 Transmitter Radiated Emissions in Restricted Bands, FCC Rule 15.205:

Radiated emission measurements were performed from 30 MHz to 40,000 MHz. Analyzer resolution is 100 kHz or greater for 30 MHz to 1000 MHz, 1 MHz for frequencies above 1000 MHz.

Data is included of the worst case configuration (the configuration which resulted in the highest emission levels). A sample calculation, configuration photographs and data tables of the emissions are included. Above 1000 MHz measurements were performed with peak and average detection.

The data on the following pages list the significant emission frequencies, the limit and the margin of compliance..

To show compliance at the band-edges frequencies, the “delta” method was used.

4.9 Transmitter Duty Cycle Calculation and Measurements, FCC Rule 15.35(b), (c)

The EUT antenna output port was connected to the input of the spectrum analyzer. The analyzer center frequency was set to EUT RF channel carrier. The SWEEP function on the analyzer was set to ZERO SPAN. The transmitter ON time was determined from the resultant time-amplitude display:

Duty cycle = Maximum ON time in 100 msec/100

Duty cycle correction, dB = 20 * log(DC)

	See attached spectrum analyzer chart(s) for transmitter timing
	See transmitter timing diagram provided by manufacturer
X	Not applicable.
