Description of EUT: 2.4/5 GHz IEEE 802.11g/a WLAN Cardbus card
Manufacturer: Agere Systems Nederland B.V.

1.4 Test methodology.

The test methodology used is based on the requirements of 47 CFR Part 15 (2003-03-13), sections 15.107, 15.207, 15.109, 15.209, 15.205 and Subpart E (Unlicensed National Information Infrastructure Devices).

The test methods, which have been used, are based on ANSI C63.4: 1992.

Radiated emission tests above 30 MHz were performed at a measurement distance of 3 meters. Below 30 MHz the radiated emission tests were carried out at measurement distances of 3 and 10 meters. The test results regarding the radiated emission tests on frequencies below 30 MHz have been extrapolated in order to determine the field strength of the measured values at measurement distances of 30 and 300 meters (as required by 47 CFR Part 15).

The bandwidth of the receiver is switching automatically to the right bandwidth in accordance with CISPR 16. This is implemented in the receiver. The antenna factors are programmed in the test receiver. The receiver automatically calculates the appropriate correction factor for the utilized antenna and also the appropriate antenna factor for the cable loss. The total correction is automatically added to the measured value.

Radiated emission tests in the frequency range of 1 GHz – 40 GHz were performed with appropriate pre-amplifiers, antennas and a spectrum analyzer. At frequencies on which radiated emissions were found the level at the input of the pre-amplifier was reproduced by means of a RF signal generator. The output level of the signal generator was then increased with the antenna factor in order to obtain the actual field strength value for each individual frequency on which radiated emissions were found.

1.5 Test facility.

The Federal Communications Commission has reviewed the technical characteristics of the test facilities at TNO Electronic Products & Services (EPS) B.V., located in Niekerk, 9822 TL Smidshornerweg 18, The Netherlands, and has found these test facilities to be in compliance with the requirements of 47 CFR Part 15, section 2.948, per October 23, 2000.

The description of the test facilities has been filed at the Office of the Federal Communications Commission under registration number 90828. The facility has been added to the list of laboratories performing these test services for the public on a fee basis.

The list of all public test facilities is available on the Internet at <http://www.fcc.gov>.

1.6 Product labeling.

In accordance with 47 CFR Part 15.19 (a)(3) the following text shall be placed on a label, which is attached to the EUT:

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

In accordance with 47 CFR Part 2.925 (a)(1), the FCC ID shall be placed on a label, which is attached to the EUT.

For further details about the labeling requirements (size, legibility, etc.) as set by the Federal Communications Commission see 47 CFR Part 15.19 (a)(3), 47 CFR Part 15.19 (b)(2), 47 CFR Part 15.19 (b)(4), 47 CFR Part 2.925 and 47 CFR Part 2.926.

1.7 System test configuration.

1.7.1 Justification.

The EUT was connected to the Cardbus slot of the host system for the purpose of proving compliance with the applicable parts of 47 CFR Part 15 in case no additional shielding of the EUT is provided by the host system. The EUT was tested while using the integral antenna of the EUT.

The justification and manipulation of cables and equipment in order to simulate a worst-case behavior of the test setup has been carried out as prescribed in ANSI C63.4: 1992.

Tests were performed at the operating frequencies channel 36 (5180 MHz), channel 48 (5240 MHz), channel 52 (5260 MHz) and channel 64 (5320 MHz). Further details may be found in table 2 below.

Channel	Operating frequencies (MHz)	Rated output power (mW)	Test performed
36	5180	15.1	yes
40	5200	15.1	no
44	5220	15.1	no
48	5240	15.1	yes
52	5260	15.1	yes
56	5280	15.1	no
60	5300	15.1	no
64	5320	15.1	yes

Table 2 - Specification of channels and rated maximum peak conducted transmit output power.

1.7.2 EUT test software.

The EUT could be enabled to transmit or receive continuously on channels 36 (5180 MHz), 48 (5240 MHz), 52 (5260 MHz) and 64 (5320 MHz) by means of test software, which was supplied by the manufacturer of the EUT. Furthermore, the utilized test software also enables various transmission bit-rate settings in the range of 6/9 Mbit/s, 12/18 Mbit/s, 24/36 Mbit/s and 48/54 Mbit/s.

1.8 Special accessories.

No special accessories are used and/or needed to achieve compliance with the appropriate sections of 47 CFR Part 15.

1.9 Equipment modifications.

No modifications have been made to the equipment in order to achieve compliance with the appropriate sections of 47 CFR Part 15.

1.10 Configuration of the tested system.

Not applicable. See table 1 in section 1.3 of this test report.

1.11 Block diagram(s) of the EUT.

The block diagram is available as part of the documentation which is to be submitted to the FCC/TCB.

4 Results of tests in conformity with 47 CFR Part 15, Subpart E.

4.1 Power limits.

4.1.1 Frequency band of 5.15 – 5.25 GHz.

The results of tests on the EUT, carried out in accordance with 47 CFR Part 15.407 (a)(1) in order to determine the –26 dB emission bandwidth of the transmitter signal, are depicted in table 12.

The procedure, which was used for measuring the –26 dB emission bandwidth of the transmitter signal, is defined in FCC Public Notice DA 02-2138 (August 30, 2002), Appendix A, emission bandwidth “B” MHz.

The plots of the results of the –26 dB emission bandwidth measurements may be found in section 5.1 of this test report.

Transmission bit-rate (Mbit/s)	-26 dBm emission bandwidth (kHz)	
	Ch. 36 (5180 MHz)	Ch. 48 (5240 MHz)
9	28800	25650
18	22800	24000
36	23100	22800
54	22950	23250

Table 12 – The results of the –26 dB emission bandwidth measurements

From table 12 above it can be derived that the minimum –26 dB emission bandwidth is 22.80 MHz.

The peak transmit power limit, based on the –26 dB emission bandwidth, in the frequency band of 5.15 – 5.25 GHz can be calculated as follows:

4 dBm + 10 log B, where B is the –26 dB emission bandwidth in MHz;

4 dBm + 10 log 22.80 = 4 dBm + 13.57 = 17.6 dBm (57.5 mW).

In accordance with 47 CFR Part 15.407 (a)(1) the peak transmit power in the frequency band of 5.15 – 5.25 GHz shall not exceed the lesser of 50 mW or 4 dBm + 10log B, where B is the –26 dB emission bandwidth in MHz. It has been determined that the peak transmit power limit, based on the –26 dB emission bandwidth, in the frequency band of 5.15 – 5.25 GHz is 17.6 dBm (57.5 mW).

In accordance with 47 CFR Part 15.407 (a)(1) the peak transmit power limit, in the frequency band of 5.15 – 5.25 GHz, has been set to 17.0 dBm (50 mW).

4.1.2 Frequency band of 5.25 – 5.35 GHz.

The results of tests on the EUT, carried out in accordance with 47 CFR Part 15.407 (a)(1) in order to determine the –26 dB emission bandwidth of the transmitter signal, are depicted in table 13.

The procedure, which was used for measuring the –26 dB emission bandwidth of the transmitter signal, is defined in FCC Public Notice DA 02-2138 (August 30, 2002), Appendix A, emission bandwidth “B” MHz.

36	22800	22050
54	21600	24300

Table 13 – The results of the –26 dB emission bandwidth measurements

From table 13 above it can be derived that the minimum –26 dB emission bandwidth is 21.60 MHz.

The peak transmit power limit, based on the –26 dB emission bandwidth, in the frequency band of 5.25 – 5.35 GHz can be calculated as follows:

11 dBm + 10 log B, where B is the –26 dB emission bandwidth in MHz;

11 dBm + 10 log 21.60 = 11 dBm + 13.3 = 24.4 dBm (275.4 mW).

In accordance with 47 CFR Part 15.407 (a)(2) the peak transmit power in the frequency band of 5.25 – 5.35 GHz shall not exceed the lesser of 250 mW or 11 dBm + 10log B, where B is the –26 dB emission bandwidth in MHz. It has been determined that the peak transmit power limit, based on the –26 dB emission bandwidth, in the frequency band of 5.25 – 5.35 GHz is 24.4 dBm (275.4 mW).

In accordance with 47 CFR Part 15.407 (a)(2) the peak transmit power limit, in the frequency band of 5.25 – 5.35 GHz, has been set to 24.0 dBm (250.0 mW).

4.2 Maximum peak conducted transmit output power.

The results of tests on the EUT, carried out in accordance with 47 CFR Part 15.407 (a)(4), are depicted in table 14. The maximum peak conducted transmit output power was measured directly at the (temporary) antenna connector.

The limits have been derived from 47 CFR Part 15.407 (a)(1) and 47 CFR Part 15.407 (a)(2), see also section 4.1 of this test report.

The procedure, which was used for measuring the maximum peak conducted transmit output power of the transmitter, is defined in FCC Public Notice DA 02-2138 (August 30, 2002), Appendix A, peak conducted transmit output power, test method #3.

The plots of the results of the maximum peak conducted transmit output power measurements may be found in section 5.2 of this test report.

Note: During the measurements, the AC mains supply voltage of the notebook PC in which the EUT was built-in was varied between 85% and 115% of the nominal value. The maximum measured values are depicted in table 14. No differences in measurement results, due to the AC mains voltage variations between 85% and 115% from the nominal value, have been observed. As the antenna gain does not exceed 6 dBi, no reduction of the maximum peak transmit output power is required.

The procedure, which was used for measuring the peak power spectral density, is defined in FCC Public Notice DA 02-2138 (August 30, 2002), Appendix A, peak power spectral density, test method #2.

The plots of the results of the peak power spectral density measurements may be found in section 5.3 of this test report.
